

Before the
Federal Communications Commission
Washington, D.C. 20554

In the Matter of)
)
Mitigation of Orbital Debris in the New Space Age) IB Docket No. 18-313
)

REPORT AND ORDER AND
FURTHER NOTICE OF PROPOSED RULEMAKING

Adopted: April 23, 2020

Released: April 24, 2020

By the Commission: Chairman Pai and Commissioners O’Rielly, Carr, and Starks issuing separate statements; Commissioner Rosenworcel concurring and issuing a statement.

Comment Date: (45 days after date of publication in the Federal Register).

Reply Comment Date: (75 days after date of publication in the Federal Register).

APPENDIX A – Final Rules	
APPENDIX B – Final Regulatory Flexibility Act	
APPENDIX C - List of Commenters	
APPENDIX D – Proposed Rules	
APPENDIX E – Initial Regulatory Flexibility Act	

I. INTRODUCTION

1. A wide range of new and existing commercial technologies depend on reliable communications with spacecraft. The cost, integrity, and reliability of these communications can be negatively affected by orbital debris, which presents an ever-increasing threat to operational spacecraft. The environment in space continues to change and evolve in the New Space Age as increasing numbers of satellites are launched and new satellite technology is developed. The regulations we adopt today are designed to ensure that the Commission's actions concerning radio communications, including licensing U.S. spacecraft and granting access to the U.S. market for non-U.S. spacecraft, mitigate the growth of orbital debris, while at the same time not creating undue regulatory obstacles to new satellite ventures. This action will help to ensure that Commission decisions are consistent with the public interest in space remaining viable for future satellites and systems and the many services that those systems provide to the public.

2. The Report and Order (Order) comprehensively updates the Commission's existing rules regarding orbital debris mitigation, which were adopted in 2004. Our goal is to provide the clearest possible regulatory framework for applicants for non-Federal satellite communications. We also seek comment in a Further Notice of Proposed Rulemaking (Further Notice) on probability of accidental explosions, collision risk for multi-satellite systems, maneuverability requirements, casualty risk, indemnification, and performance bonds tied to successful spacecraft disposal.

II. BACKGROUND

3. There are a variety of predictions for how the space economy and space environment will evolve in the coming New Space Age, but one clear indicator of the changes to come is the unprecedented number of non-geostationary orbit (NGSO) space stations¹ for which applications have been submitted at the FCC.² Some of the systems have begun preliminary operations, and we expect these activities to accelerate in the coming years. These new large constellations, many of which are designed to provide global broadband services, are likely to bring thousands of new satellites to low-Earth orbit (LEO). At the same time, there are a number of commercial systems with more than a hundred satellites that are already fully operational and providing commercial imaging and other Earth-exploration services.³ Additional satellite constellations, again in potentially large numbers, will be coming online to provide other innovative services such as “Internet of Things.” Moreover, the last decade has seen an exponential increase in the number of operations by small satellites with short duration missions for academic and research purposes, as the miniaturization of electronic components along with increased “rideshare” launch opportunities has led to the flourishing of “CubeSat” spacecraft missions, including launches with unprecedented numbers of satellites on board.⁴ In the meantime, operators continue to launch new, technologically-advanced communications satellites into the geostationary orbit (GSO), providing critical services across the globe.

4. At the same time, studies indicate that already in some regions of LEO, the number of new objects and fragments generated from collisions exceeds those removed by natural atmospheric drag.⁵ Other regions have sufficient densities of orbital debris to lead some analysts to conclude that they are close to or have already reached a “runaway” status, where the debris population will grow indefinitely due to collisions between debris objects.⁶ The predicted increase in the number of satellites in

¹ Throughout this Order, we use the terms “space station,” “satellite,” and “spacecraft.” “Space station” is defined in the Commission’s rules as “[a] station” located on an object which is beyond, is intended to go beyond, or has been beyond, the major portion of the Earth’s atmosphere.” 47 CFR §§ 2.1, 25.103. This is consistent with terminology used by the International Telecommunication Union (ITU). ITU Radio Regulations (R.R.) 1.64. The Commission’s rules define “satellite” as “[a] body which revolves around another body of preponderant mass, and which has a motion primarily and permanently determined by the force of attraction of that other body.” 47 CFR § 2.1. In this Order we refer only to artificial satellites. The Commission’s rules define “spacecraft” as “[a] man-made vehicle which is intended to go beyond the major portion of the Earth’s atmosphere.” 47 CFR §§ 2.1, 25.103. These terms are used interchangeably in this Order, but we observe that “satellite” and “spacecraft” are more broadly defined than “space station.”

² Recent reports indicate that commercial services are increasingly being provided by smaller-size NGSO satellites, and that most of these satellites are authorized by the United States. One report indicates, for example, that 62% of those NGSO satellites under 1,200 kilograms are now providing commercial service. See Bryce Space and Technology, *Smallsats by the Numbers 2020*, available at <https://brycetechnology.com/reports.html>. 899 commercial satellites under 1,200 kilograms were launched between 2012 and 2019, and 70% of these have been operated by Planet, SpaceX, or Spire, all of whom have been granted authorization by the Commission. *Id.*

³ The Earth exploration-satellite service generally includes collection and communication of information related to the characteristics of the Earth and its natural phenomena, as obtained from active or passive sensors. ITU R.R. 1.51.

⁴ See *Streamlining Licensing Procedures for Small Satellites*, Report and Order, 34 FCC Rcd 13077, 13078, para. 1 (2019) (*Small Satellite Order*).

⁵ Gian Luigi Somma, et. al., “Space Debris: Analysis of a Large Constellation at 1200 km Altitude,” at 1, 69th International Astronautical Congress (October 2018) (describing the current status of space debris environment in the introduction).

⁶ For a more detailed discussion of this phenomenon, see National Research Council, *Orbital Debris: A Technical Assessment* 6-7, 160-167 ((1995). Researchers modeling the orbital environment have concluded that each orbital region has a “critical density,” at which point it contains enough objects with sufficient mass that the rate of fragments produced from collisions is greater than the rate at which objects are removed due to forces such as

(continued....)

orbit requires that orbital debris mitigation be taken seriously by all operators in order to ensure the continued safe and reliable use of space for satellite communications and other activities. The number of U.S. commercial satellites in space exceeds the number of U.S. government satellites,⁷ and the actions taken by operators today have the potential to impact the orbital environment for hundreds or thousands of years.

5. The Commission first adopted comprehensive rules on orbital debris mitigation in 2004 in its *Mitigation of Orbital Debris* Second Report and Order.⁸ The rules require disclosure of an applicant's debris mitigation plans as part of the technical information submitted to the Commission.⁹ The Commission reasoned that the disclosures would allow the Commission to examine whether a space station operator has taken orbital debris into consideration, while finding that the costs associated with disclosure would not be unduly burdensome when balanced against the public interest benefits of preserving safe and affordable access to space, and disclosure would provide flexibility for the Commission to address new developments in space station design and permit discretion when granting conditioning, or denying an authorization.¹⁰ As part of its *2004 Orbital Debris Order*, the Commission also explained how its orbital debris rules related to certain regulations of the National Oceanic and Atmospheric Administration (NOAA) and regulations of the Department of Transportation, Federal Aviation Administration (FAA).¹¹ Additionally, the Commission applied the new rules to amateur and experimental space stations, authorized under parts 97 and 5 of the Commission's rules, respectively,¹² and considered liability issues and insurance as they related to Commission-authorized space stations.¹³

6. Since 2004, there have been a variety of technical and policy updates to orbital debris mitigation standards, policy, and guidance documents. Additionally, scientific research and policy discussions on debris mitigation have continued in a wide variety of existing and new forums both in the United States and internationally.

7. In the United States, Space Policy Directive-3 (SPD-3), titled "National Space Traffic Management Policy,"¹⁴ recognized the growing threat to space activities from orbital debris, and directs the Administrator of the National Aeronautics and Space Administration (NASA), in coordination with the Secretaries of State, Defense, Commerce, and Transportation, and the Director of National Intelligence, and in consultation with the Chairman of the Commission, to lead efforts to update the U.S. Government Orbital Debris Mitigation Standard Practices (ODMSP) and establish new guidelines for

(Continued from previous page) _____

atmospheric drag, creating a collision hazard in the orbital region that may be too high for most space operations. *Id.* at 160-161. This is sometimes referred to as the "Kessler Syndrome" or "Kessler Effect."

⁷ The Union of Concerned Scientists, for example, estimates that there are 1,007 active U.S. satellites, with 620 of those being commercial satellites. *See* Union of Concerned Scientists, UCS Satellite Database, <https://www.ucsusa.org/resources/satellite-database> (last visited March 24, 2020) (database updated with launches as of Sept. 30, 2019).

satellite design and operation.¹⁵ The ODMSP apply to missions operated or procured by U.S. government agencies, and “provides a reference for to promote efficient and effective space safety practices for other domestic and international operators.”¹⁶ SPD-3 stated that the United States should eventually incorporate appropriate standards and best practices, derived in part from the ODMSP, into Federal law and regulation through appropriate rulemaking or licensing actions, and that such guidelines should encompass protocols for all stages of satellite operation from design through end-of-life.¹⁷ This rulemaking is one such activity.

8. The updated ODMSP were issued on December 10, 2019.¹⁸ This represents the first update to the ODMSP since the practices were originally established in 2001.¹⁹ The preamble states that the revised ODMSP includes “improvements to the original objectives as well as clarification and additional standard practices for certain classes of space operations.”²⁰ The revised ODMSP preamble states that the United States Government “will follow the ODMSP, consistent with mission requirements and cost effectiveness in the procurement and operation of spacecraft, launch services, and the conduct of tests and experiments in space.”²¹ The preamble goes on to state that “[w]hen practical, operators should consider the benefits of going beyond the standard practices and take additional steps to limit the generation of orbital debris.”²²

9. At the U.S. government agency level,²³ the NASA Technical Standard (NASA Standard) and other NASA documents contain additional detail informing orbital debris mitigation measures when it comes to the development of NASA programs and projects.²⁴ The NASA Standard provides specific technical requirements for limiting orbital debris generation consistent with NASA policies, and has been updated regularly, with the most recent update on April 25, 2019.²⁵ The NASA Orbital Debris Program

²² *Id.*

²³ We note that other U.S. government entities also have policies for limiting orbital debris related to those entities’ space operations. For example, the U.S. Air Force Instruction 91-217, Space Safety and Mishap Prevention Program, contains guidance on space safety, including instructions related to minimizing debris for operations of orbital space systems. See Air Force Instruction 91-217, Space Safety and Mishap Prevention Program (certified current as of May 16, 2017), available at https://static.e-publishing.af.mil/production/1/af_se/publication/afi91-217/afi91-217.pdf (Air Force Instruction 91-217).

²⁵ See generally NASA Standard.

Office also develops and maintains a number of software modelling tools designed to assist with current orbital debris mitigation analysis and help better understand the evolution of the orbital environment.²⁶ Several of these are available at no cost to the public. The software modeling tool that has been used by many Commission applicants is the NASA Debris Assessment Software, which provides a means of calculating, during the planning and design phase, various metrics-related debris mitigation practices such as assessing collision risk and casualty risk, which are relevant to some, but not all, of the Commission's requirements.²⁷ The FAA (for launch vehicles and intact re-entry) and NOAA (for commercial remote sensing satellites) both have orbital debris-related regulations which apply to non-government (in most cases commercial) operators licensed by those agencies.²⁸ Both agencies are currently considering updates to their rules, including some rules relevant to orbital debris mitigation.²⁹

10. Internationally, there have been a number of significant developments relevant to the mitigation of orbital debris. The Inter-Agency Space Debris Coordination Committee (IADC), an international forum of government bodies that includes NASA and other space agencies, "for the coordination of activities related to the issues of man-made and natural debris in space[.]" issued an updated set of consensus guidelines for debris mitigation in 2007.³⁰ The IADC Guidelines cover a wide range of topics including limitation of debris released during normal operations, minimization of the potential for on-orbit break-ups, post-mission disposal, and prevention of on-orbit collisions.³¹ Work by the IADC also helped to inform the development of the Space Debris Mitigation Guidelines of the United Nations (UN) Committee on the Peaceful Uses of Outer Space,³² which were endorsed by the UN General Assembly in 2007.³³ As with the IADC Guidelines, the UN Guidelines established voluntary, non-

²⁶ See NASA, Orbital Debris Program Office, <https://orbitaldebris.jsc.nasa.gov/> (with links to several software modeling tools on the homepage).

²⁷ See NASA Software, Debris Assessment Software 3.0, <https://software.nasa.gov/software/MSC-26690-1> (last visited Jan. 14, 2020). The software is also updated periodically, with the most recent update in July 2019. NASA also issues a User Guide for the Debris Assessment Software, available at <https://ntrs.nasa.gov/archive/nasa/casi.ntrs.nasa.gov/20190027721.pdf>. Additionally, the software reflects the structure of the NASA Standard and provides the user with tools to assess compliance with the requirements of the NASA Standard for reduction of orbital debris. See NASA Software, Debris Assessment Software 3.0.

³¹ IADC Guidelines at 5.

³² See IADC Guidelines at 3; United Nations General Assembly, "Space Debris Mitigation Guidelines of the Committee on the Peaceful Uses of Outer Space," A/RES/62/217, at iii-iv, 4 (2007), http://www.unoosa.org/pdf/publications/st_space_49E.pdf (UN Guidelines).

³³ UN Guidelines at iv. The UN General Assembly agreed that the voluntary guidelines "reflected the existing practices as developed by a number of national and international organizations, and invited Member States to implement those guidelines through relevant national mechanisms." *Id.*

binding consensus principles and guidelines for space debris mitigation.³⁴ More recent developments include the IADC issuance in 2017 of a “Statement on Large Constellations of Satellites in Low Earth Orbit,”³⁵ as well as the adoption by the Committee on the Peaceful Uses of Outer Space of a preamble and 21 consensus guidelines for the “Long-Term Sustainability of Space Activities.”³⁶ Additionally, there are international standards-setting organizations, such as the International Standards Organization that have issued standards for space activities, including orbital debris mitigation.³⁷

11. The commercial space industry has been increasingly active in developing voluntary, consensus-based principles and guidelines through industry associations and working groups. In 2019, an organization known as the Space Safety Coalition published a set of best practices for long-term sustainability of space operations, which have been endorsed by at least 37 entities, primarily commercial space companies.³⁸ Also in 2019, the Satellite Industry Association (SIA), a trade association representing satellite operators, service providers, manufacturers, launch services providers, and ground equipment suppliers released a set of “Principles of Space Safety.”³⁹ Both of these documents emphasize the importance of responsible space operations to ensure the long-term sustainability of the space environment. There have also been standards and guidance issued by organizations focusing on specific operational areas, such as the standards and recommended practices developed by the Consortium for Execution of Rendezvous and Servicing Operations for commercial rendezvous, proximity operations, and on-orbit servicing.⁴⁰ Additionally, organizations such as the World Economic Forum’s Global Future Council on Space Technologies are working toward other approaches to space debris, for example, a “Space Sustainability Rating” that would provide a score representing a mission’s sustainability as it relates to debris mitigation and alignment with international guidelines.⁴¹

12. The Commission adopted a Notice of Proposed Rulemaking (*Notice*) on November 15, 2018 seeking comment on a comprehensive update to its rules relating to orbital debris mitigation.⁴² It

sought comment on issues ranging from minor updates codifying established metrics into existing rules to how to assess the risks posed by constellations of thousands of satellites, as well as topics such as economic incentives for operators that would align with orbital debris mitigation best practices.

13. Comments on the *Notice* were due April 5, 2019, and reply comments were due May 6, 2019.⁴³ We received 45 comments and 19 reply comments.⁴⁴ A list of commenters, reply commenters, and other filers is contained in Appendix C.

III. DISCUSSION

14. In the discussion that follows, we first address the Commission’s overall regulatory approach to orbital debris mitigation, including economic and other issues. We then discuss the need for rule modifications to address topics such as collision risk, orbit selection, trackability, and minimizing release of debris. Next, we address post-mission disposal, as well as other topics such as proximity operations, security of spacecraft commands, and orbit-raising. Then, we discuss liability issues and economic incentives, and finally, we address the scope of our rules and other miscellaneous issues raised by commenters.

A. Regulatory Approach to Mitigation of Orbital Debris

1. FCC Statutory Authority Regarding Orbital Debris

15. The Commission licenses radio frequency uses by satellites under the authority of the Communications Act of 1934, as amended (the Act).⁴⁵ When the Commission adopted debris mitigation rules applying to satellites across all service types, the Commission concluded that its authority to review orbital debris mitigation plans fell within its responsibilities and obligations under the Act, derived from its authority with respect to authorizing radio communications.⁴⁶ As the Commission then noted, the Act charges the FCC with encouraging “the larger and more effective use of radio in the public interest.”⁴⁷ Additionally, the Act provides for the licensing of radio communications, including satellite communications,⁴⁸ only upon a finding that the “public convenience, interest, or necessity will be served thereby.”⁴⁹ These provisions of the Act have remained unchanged since the Commission’s previous analysis of its authority in this area, in which it concluded that orbital debris and related mitigation issues are relevant in determining whether the public interest would be served by authorization of any particular satellite-based communications system, or by any particular practice or operating procedure of such satellite systems.⁵⁰ The analysis undertaken by the Commission is designed to ensure that the space systems reviewed by the Commission have sufficient plans to mitigate orbital debris, consistent with the

⁴³ See *Mitigation of Orbital Debris in the New Space Age*, Proposed Rules, 84 FR 4742 (February 19, 2019).

⁴⁴ See Federal Communications Commission, Electronic Comment Filing System, IB Docket No. 18-313.

⁴⁵ Communications Act of 1934, as amended, 47 U.S.C. § 151 *et seq.* The Commission does not license communications for radio stations “belonging to and operated by” the United States government. See 47 U.S.C. 305(a).

⁴⁶ *2004 Orbital Debris Order*, 19 FCC Red at 11575, para. 14.

⁴⁷ 47 U.S.C. § 303(g). The Supreme Court has found that the meaning of a public interest standard in a legislative statute takes meaning from the purpose of that legislation. *NAACP v. Federal Power Commission*, 425 U.S. 662, 669 & FN 7 (1976); see also *Cellco Partnership v. FCC*, 700 F.3d 534, 542 (D.C. Cir. 2012), citing to *NBC v. U.S.*, 319 U.S. 190 (1943) (“[T]he supreme court has emphasized that [Title III] does endow the Commission with ‘expansive powers’ and a ‘comprehensive mandate to...encourage the larger and more effective use of radio in the public interest.’”).

⁴⁸ 47 U.S.C. § 301.

⁴⁹ 47 U.S.C. § 307(a).

⁵⁰ *2004 Orbital Debris Order*, 19 FCC Red at 11575, para. 14.

public interest. As the Commission also previously concluded, to the extent that spacecraft are controlled through radiocommunications links, there is a direct connection between the radiocommunications functions we are charged with licensing under the Act and the physical operations of the spacecraft.⁵¹ Rules that limit the generation of orbital debris are intended to minimize the orbital debris that would negatively affect the cost, reliability, continuity and safety of all commercial, experimental and amateur satellite operations licensed or authorized by the Commission.⁵² Orbital debris also negatively affects the availability, integrity, and capability of both incumbent and newly-authorized satellite systems, thereby raising the potential for impairing the ability of such systems to use the spectrum to the full extent that the Commission authorized.

16. We note that even prior to the adoption of a comprehensive set of rules on orbital debris mitigation in 2004, the Commission was reviewing the orbital debris mitigation plans of satellites and systems on a case-by-case basis.⁵³ Rules requiring disclosure of plans to mitigate orbital debris were adopted for licensees in the 2 GHz mobile-satellite service in 2000, and those rules were the basis for rules applicable to all services that were adopted shortly thereafter.⁵⁴ Thus, as part of its licensing and grant of space systems, the Commission has been reviewing the orbital debris mitigation plans of non-Federal satellites and systems for over 20 years.

17. The *Notice* sought comment on whether the 2004 order cited all relevant and potential sources of Commission authority in this area, and whether the provisions discussed, or other provisions, provide the Commission with requisite authority in this area.⁵⁵ Several commenters agree with the Commission taking a refreshed look at its authority in this area.⁵⁶ No commenters, however, make specific arguments questioning the Commission's statutory authority generally, express different views on the Commission's authority pursuant to the Communications Act, or offer other views on sources of Commission authority. We therefore see no reason to arrive at a different conclusion than the Commission did in 2004 with respect to the Commission's authority on review of orbital debris mitigation plans.

18. Some commenters emphasize that the Commission should revisit its authority considering the authority of other agencies and organizations, in the interest of avoiding duplicative requirements and standards.⁵⁷ We recognize, as observed by the Commerce Department, that significant elements of non-Federal space operations are subject to regulation by other Federal agencies, most

⁵³ *2004 Orbital Debris Order*, 19 FCC Rcd at 11571, para. 7.

⁵⁴ *Id.*; see *Establishment of Policies and Service Rules for Mobile Satellite Service in the 2 GHz Band*, Report and Order, 15 FCC Rcd 16127, 16187-88, paras. 135-138 (2000). See also *Establishment of Policies and Service Rules for the Non-Geostationary Satellite Orbit, Fixed Satellite Service in the Ku-Band*, Report and Order and Further Notice of Proposed Rulemaking, 17 FCC Rcd 7841, 7865-66, para. 81 (2002) (applying to systems operating in the Ku-Band NGSO fixed-satellite service (FSS)); *Establishment of Policies and Service Rules for the Non-Geostationary Satellite Orbit, Fixed Satellite Service in the Ka-Band*, 18 FCC Rcd 14708, 14725-26, para. 55 (2003) (applying to systems operating in the Ka-Band NGSO FSS); *Amendment of the Commission's Space Station Licensing Rules and Policies, Mitigation of Orbital Debris*, First Report and Order, 18 FCC Rcd 10760, 10784-85, para. 53 (2003) (applying to systems that would operate under default service rules).

⁵⁵ *Notice*, 33 FCC Rcd at 11358, para. 15.

⁵⁶ See, e.g., Space Exploration Technologies Corp. (SpaceX) Comments at 1, 4 (rec. April 5, 2019) (SpaceX Comments); Intelsat License LLC Comments at 1, 2 (rec. April 5, 2019) (Intelsat Comments).

⁵⁷ See, e.g., Intelsat Comments at 1; SIA Comments at 3; SpaceX Comments at 4, n.4.

notably NOAA and the FAA.⁵⁸ We continue to work closely with other agencies to ensure that our activities are not duplicative of their activities, and coordinate with other agencies in individual cases, as necessary. To the extent that commenters ask us to refresh the legal analysis of our authority in light of the evolution of international standards,⁵⁹ we note that changes in international guidelines related to the mitigation of orbital debris can and do inform regulatory approaches, but do not have the force of law and would not alter the FCC's legal authority in this area.

19. A few commenters correctly observe that some of the Commission's *Notice* proposals go beyond a narrower focus on debris mitigation, such as in the ODMSP, and also relate in part to other functional areas often referred to as space situational awareness or space traffic management.⁶⁰ These functional areas generally concern the collection and dissemination of data about objects and activities in space (space situational awareness), and the management of activities in space to ensure safe operations, through measures such as coordination and collision avoidance (space traffic management). As an example of a rule that goes beyond the guidelines in the ODMSP, the rule we codify below regarding ability of an FCC-licensed spacecraft to be tracked can improve both the ability to monitor the space environment (space situational awareness) as well as the ability of operators to coordinate amongst each other and make informed decisions to prevent collisions (space traffic management).⁶¹ These improvements in turn may reduce the likelihood that new debris will be created in space. We conclude that even though some of the rules we adopt in this Order may involve or relate to concepts of space situational awareness or space traffic management, because they are directly tied to the mitigation of orbital debris and will contribute to the Commission's ability to ensure that non-Federal satellite systems will serve the public interest, these rules fall within the Commission's broad authority under Title III of the Act to license radio spectrum pursuant to that public interest mandate.

2. Relationship with Other U.S. Government Activities

20. The *Notice* recognized the importance of a coordinated, effective regulatory environment that meets the dual goals of orbital debris mitigation and furthering U.S. space commerce.⁶² Specifically, in the *Notice*, the Commission sought comment on whether there are any areas in which the proposed requirements overlap with requirements clearly within the authority of other agencies, in order to avoid duplicative activities, and whether there are any exceptions to applications of our rules that would be appropriate in specific circumstances.⁶³ The *Notice* also highlighted the ongoing activities of various executive branch agencies of the U.S. government related to the Space Policy Directive-3 (SPD-3), including the now-completed updating of the ODMSP. In accordance with its consultative role described

⁵⁸ See United States Department of Commerce Comments at 2 (rec. April 5, 2019) (Commerce Department Comments).

⁵⁹ See, e.g., Intelsat Comments at 3; EchoStar/Hughes Comments at 4.

⁶⁰ See, e.g., NASA Comments at 1; Comments of Darren McKnight, Integrity Applications, at 2 (filed Dec. 17, 2018) (McKnight Comments). Many aspects of space situational awareness and space traffic management, as relevant to non-U.S. government operators, are managed by the Department of Defense, U.S. Air Force – currently the 18th Space Control Squadron. See Peterson Air Force Base, Fact Sheets, 18th Space Control Squadron (March 22, 2018), <https://www.peterson.af.mil/About/Fact-Sheets/Display/Article/1060346/18th-space-control-squadron/> (last visited Jan. 14, 2020). The 18th Space Control Squadron is a tactical unit under the U.S. Air Force 21st Space Wing responsible for maintaining and providing foundational space situational awareness for the U.S. Department of Defense, as well as interagency, commercial, and international partners. See *id.*

⁶¹ See part III.C.

⁶² *Notice*, 33 FCC Rcd at 11358, para. 14.

⁶³ *Id.* at 11359, para.17.

in SPD-3, the Commission has been engaged with those ongoing activities.⁶⁴ The *Notice* additionally sought comment on the suitability of various orbital debris mitigation guidance and standards.⁶⁵

21. Commenters addressing these topics universally supported interagency coordination, and many mentioned the sharing of expertise regarding space operations.⁶⁶ Commenters also generally supported application of consistent principles as well as elimination of regulatory duplication.⁶⁷ The Commerce Department provided informative comments describing in detail many of the Commerce Department and interagency initiatives currently underway as a result of the Space Policy Directives.⁶⁸ At this time, we are pleased to highlight the recent completion of the revisions to the ODMSP, and look forward to further work with the Commerce Department and other agencies on an evolving “whole of

⁶⁴ See Space Policy Directive-3, Section 6(b)(1).

⁶⁵ *Notice*, 33 FCC Rcd at 11357, para. 11.

⁶⁶ See, e.g., SpaceX Comments at 4 (supporting any efforts toward interagency coordination and the pooling of expertise across space operations); EchoStar Satellite Operating Corporation and Hughes Network Systems, LLC Comments at 1-2, 4-5 (rec. April 5, 2019) (EchoStar/Hughes Comments) (recommending that the Commission narrowly construe its jurisdiction to reflect its core competencies with respect to orbital debris and defer to the authority and expertise of other U.S. or international agencies tasked with developing specific technical criteria for mitigating orbital debris); WorldVu Satellites Limited Comments at 2 (rec. April 5, 2019) (OneWeb Comments) (stating that the Commission should ensure that the proceeding contributes to a framework that gives due consideration to subject matter expertise and resources possessed by other Federal agencies and regulatory bodies); Astroscale Holdings, Altius Space Machines, Inc., Nanoracks LLC, OrbitFab, Inc., Rocco, LLC, Spacebridge Logistics, Inc, Space Exploration Engineering, LLC, SpaceNav, LLC (collectively, Global NewSpace Operators) Comments at 21 (rec. April 5, 2019) (Global NewSpace Operators Comments) (suggesting that the Commission collaborate with experts in the debris mitigation review process, while not adding to the complexity or time required towards a license); Lockheed Martin Corporation Comments at 3 (rec. April 5, 2019) (Lockheed Martin Comments) (asserting that the success of any orbital debris mitigation policies depends on a whole-of-government approach in the United States, given the vested interests and critical roles of multiple departments and agencies in the space domain); Satellite Industry Association Comments at 3 (rec. April 5, 2019) (SIA Comments) (stating that the Commission should seek out and take into account the relevant technical expertise of other federal agencies and U.S. governmental bodies, as well as international entities with subject-matter interest); Duke Science Regulation Lab Comments at 12-16 (rec. April 5, 2019) (Duke SciReg Lab Comments) (suggesting that the Commission consider the relevant expertise, experience, and relevance of other federal agencies).

⁶⁷ See, e.g., SpaceX Comments at 4 (supporting coordination to establish which Federal agency has the appropriate lead for a given activity, consistent with statutory authority); NASA Comments at 8 (observing that in situations where another U.S. government department or agency has effective oversight over a non-Federal operation in space, duplication may occur, and recommends consultation between respective Federal entities to eliminate any ambiguity and potential duplication); EchoStar/Hughes Comments at 4 (stating that the Commission should avoid adopting debris mitigation requirements that overlap with those within the authority and expertise of other agencies); OneWeb Comments at 2 (agreeing that a coordinated, effective regulatory environment is essential to the health of the satellite industry); Spaceflight, Inc. Comments at 7 (rec. April 5, 2019) (Spaceflight Comments) (suggesting that the Commission update its rules in coordination with other U.S. departments and agencies to ensure that establishment of consistent rules and policies with clear lines of demarcation as to which department or agency may be responsible for authorizing particular missions); SIA Comments at 4 (stating that rules and amendments adopted during this proceeding should support a comprehensive national framework); AT&T Services, Inc. Reply Comments at 3 (rec. May 6, 2019) (AT&T Reply) (observing that the record strongly supports formal coordination among relevant agencies).

⁶⁸ Commerce Department Comments at 3. Boeing similarly suggests that the Commission defer adoption of new rules until completion of a “comprehensive examination” by the U.S. Federal government). The Boeing Company Reply Comments at 6 (rec. May 6, 2019) (Boeing Reply). Boeing subsequently submitted an *ex parte* filing commenting on the revisions to the ODMSP as they relate to the Commission’s proposals. See The Boeing Company, Supplemental Comments *Ex Parte*, IB Docket 18-313, at ii (filed Feb. 14, 2020) (Boeing Feb. 14, 2020 *Ex Parte*).

government” approach to space activities. Given the pace that the industry is evolving, and our responsibility to continue licensing satellites and systems on a day-to-day basis,⁶⁹ we find that it would not be beneficial at this time to delay our rule updates. We expect that regulation of orbital debris will be an iterative process as new research becomes available and new policies are developed, and as discussions continue concerning approaches to improving the organization of the regulation of space activities. If it becomes clear through a change to the governing law that an activity the Commission is currently undertaking is instead one that another agency is charged with performing, we will modify our process and regulations accordingly.

22. We continue to carefully follow the rulemaking developments of other agencies, in particular those of the FAA and NOAA, as those agencies look to update their rules related to authorization of commercial space activities.⁷⁰ The *Notice* did not propose any change to the specific conclusions drawn by the Commission in 2004 with respect to the role of the Commission vis-à-vis other agencies such as the FAA and NOAA.⁷¹ We will continue to coordinate closely with other agencies in any cases where it appears that the other agency may have relevant expertise or in cases that present unique scenarios that implicate overlap with that agency’s responsibilities.⁷²

23. Consistent with the coordinated approach recommended by many commenters, we look to the recent updates to the ODMSP to help inform our rules. The revised ODMSP addresses the same general topics and issues as the proposals in the *Notice*, and as discussed by commenters in the record developed in this proceeding.⁷³ Similar to the approach that the Commission took in 2004, the organization of this Order and Further Notice generally follows the organization of the ODMSP objectives, and in the relevant content areas we describe the revised ODMSP approach. As requested by the Commerce Department, we use, to the extent feasible, the most recent updates to the ODMSP.⁷⁴

⁶⁹ See, e.g., Secure World Foundation Comments at 3 (suggesting that at this moment at least the Commission continue to include orbital debris mitigation requirements in its licensing of satellite systems, as it has the broadest reach of any of the existing U.S. regulatory agencies for space, and without the Commission playing the role there would likely be multiple private sector entities conducting space activities that are not adequately covered by other U.S. regulatory authorities); Global NewSpace Operators Comments at 21 (noting that benefits such as transparency and global reach have resulted from the Commission’s role in orbital debris mitigation regulation); AT&T Reply Comments at 4-5 (supporting Commission regulation of debris mitigation given its success over the past fifteen years through flexible, performance-based requirements).

⁷⁰ See Federal Aviation Administration, Streamlined Launch and Reentry Licensing Requirements, Notice of Proposed Rulemaking, 84 FR 15296, 15307 (April 14, 2019); National Environmental Satellite, Data, and Information Service, National Oceanic and Atmospheric Administration, Department of Commerce, Licensing of Private Remote Sensing Space Systems, Proposed Rule, 84 FR 21282, 21286 (May 14, 2019).

⁷¹ *Notice*, 33 FCC Rcd at 11358-59, paras. 16-17.

⁷² A good example is our coordination with NASA in cases where the International Space Station (ISS) is implicated in the planned operations of a non-Federal satellite or system. See, e.g., Spire Global, Inc., SAT-LOA-20151123-00078 (deployment of CubeSats from the OA-5 Cygnus launch vehicle into orbit above the ISS, after the launch vehicle docked with the ISS).

⁷³ See *Notice*, 33 FCC Rcd at 11358, para. 14.

⁷⁴ Boeing states that in aligning the Commission’s rules with the ODMSP, the Commission should consider both those instances in which a particular requirement was included in the ODMSP and “those instances in which [U.S. government agencies] concluded that the adoption of new requirements or modifications was premature or unwarranted.” Boeing Feb. 14, 2020 *Ex Parte* at 3-4. The ODMSP applies, by its terms, only to government missions that are procured and operated by government agencies for governmental purposes, and is applied within the context of agency procurement and contracting regulations, budgetary processes, etc., rather than in the context of regulatory review. Consequently, there is some tailoring of the ODMSP necessary to incorporate them into the Commission’s existing regulatory structure, and there are also areas where we believe it is beneficial to provide
(continued....)

24. A number of commenters suggested that the Commission participate in international processes regarding mitigation of orbital debris.⁷⁵ We observe that Commission representatives have participated as part of official U.S. government delegations in established international forums, such as the United Nations, IADC, and International Telecommunication Union, and will continue to participate through established channels under the guidance of the U.S. State Department or U.S. government entity with responsibility for overseeing the international activities.

3. Economic Considerations

25. In addition to regulatory requirements to control or mitigate orbital debris, certain commenters argue that developing mechanisms and processes that harness market forces can lead to a close alignment of private and public interests.⁷⁶ Market-based methodologies rely upon market dynamics and economic principles that generate efficiencies not always achieved by command-and-control regulation. As a growing share of space is accounted for by orbital debris, public welfare is promoted when industry participants have economic incentives to consider the public welfare benefits of reducing orbital debris as offset by any public welfare costs associated with taking measures to reduce the generation of such debris. Such benefits include decreased operational risk due to the reduced potential for collisions with space debris. Moreover, because most useful orbital altitudes are limited but also available for use by others at an effective price that does not necessarily reflect the cost each user imposes on others, they constitute a “common pool resource” such that the effective price⁷⁷ to use space does not prevent its over-use. Given the substantial commercial sector investments in space, as noted by the increase in satellite launches and the potential concomitant increase in debris, an important challenge for regulators going forward is to adopt rules and explore economic mechanisms that promote the public interest in the safe and sustainable use of space.

26. In the *Notice*, the Commission included a regulatory impact analysis designed to assess various approaches to reducing debris in orbit from an economic perspective.⁷⁸ Many of these approaches were consistent with the rule revisions proposed by the Commission in the *Notice*, and others represented different means of reducing debris. To the extent that the comments directed to this section overlapped with other topics in the *Notice*, we discuss those comments in the various sections below. Commenters generally disagreed with the additional approaches discussed as part of the regulatory impact analysis, such as limiting launches, and as addressed below, we decline to further address those approaches at this time. Several commenters presented views on novel approaches, at least in the space debris context, for incentivizing particular activities.⁷⁹ For example, the New York University School of Law Institute for Policy Integrity proposed that the Commission broadly consider market-based alternatives such as

(Continued from previous page) _____

more detailed guidance to operators. As recognized in the ODMSP, its guidelines are one element of space safety, and we also incorporate into our rules other requirements that go beyond the scope of the ODMSP.

⁷⁵ See, e.g., Global NewSpace Operators Comments at 22; Spaceflight Comments at 7. See also Duke SciReg Lab Comments at 5, 16-17 (suggesting that the Commission use information gained through an inter-agency task force to incorporate the concerns of space actors internationally).

⁷⁶ See New York University School of Law Institute for Policy Integrity Comments at 1-2 (rec. April 5, 2019) (NYU Comments).

⁷⁷ The effective price includes application and regulatory fees and the costs of building and operating a satellite. None of these costs reflect the cost any satellite operator imposes on other operators.

⁷⁸ *Notice*, 33 FCC Rcd at 11382-86, paras. 88-100. The Commission sought comment on six approaches: fewer launches, changes in satellite design, changes in operations and disposal procedures, use of economic incentives, active collision avoidance, and active debris cleanup. *Id.*

⁷⁹ See, e.g., NYU Comments at 1-2; Duke SciReg Lab Comments at 20-24 (suggesting a priority review voucher system to incentivize certain activities in space).

different liability rules, marketable permits or offsets, and regulatory fees.⁸⁰ Although we ultimately conclude that these approaches are not sufficiently robust on their own to address the problem of orbital debris, and thus regulation in this area is necessary, we address these and other approaches below.

27. Given the nature of space, some commenters raise the point that the Commission's actions in this area may be limited in value since they cannot account for activities of actors that are not subject to U.S. law and regulations. Although we address the application of our rules to non-U.S.-licensed satellites in more detail below, as an introductory matter it is worth pointing out that we have been applying, and will continue to apply, our rules on orbital debris mitigation to those operators of existing or planned non-U.S.-licensed satellites seeking access to the United States market. This means that any non-Federal satellite communicating with an earth station in the United States will be subject to an orbital debris assessment under the Commission's rules.⁸¹ Given the interest by many satellite operators in serving the U.S. market, this provides means for our regulations to have a broader reach than if the regulations were just to apply to operators seeking a U.S. license, and helps to ensure that non-U.S. licensees do not gain competitive advantage by following less rigorous debris mitigation practices than U.S.-licensed satellites.

4. Other Introductory Matters

28. A number of commenters state that the Commission should focus its efforts on performance-based regulation, rather than prescriptive regulation (e.g., regulation of satellite performance rather than regulation of design).⁸² We have endeavored throughout this Order to adopt a performance-based approach where feasible. We agree with those commenters who argue, for example, that performance metrics can enable operators to develop innovative and cost-effective solutions in many instances.⁸³

29. Several commenters also request that rules be based on specific metrics to ensure regulatory transparency, and that the Commission provide clear guidance on how to achieve certain metrics.⁸⁴ In many areas we are providing metrics and identifying methodology, typically using publicly-available NASA assessment tools, which are already used by many satellite applicants.⁸⁵ In these cases, applicants may look to detailed guidance published by NASA in preparing orbital debris mitigation plans. There will continue to be some areas, such as those in which the U.S. Government Orbital Debris Mitigation Standard Practices express qualitative objectives or aspirational goals, without a quantitative

⁸⁰ NYU Comments at 1 (asking that the Commission consider market-based alternatives in addition to the bonding and insurance requirements that the Commission raised in the *Notice*); *see Notice*, 33 FCC Rcd at 11380, para. 81 (seeking comment on what economic approaches might be feasible and effective in creating incentives such that appropriate launch vehicle and satellite design choices are made, and appropriate decisions regarding the number of satellites launched are made as well).

⁸¹ The requirement of providing information on orbital debris mitigation has been, and will continue to be, applicable to part 25 satellites, including those granted U.S. market access, as well as part 5 experimental and part 97 amateur satellites.

⁸² *See, e.g.*, NASA Comments at 8; SpaceX Comments at 9; EchoStar/Hughes Comments at 7-8.

⁸³ *See, e.g.*, SpaceX Comments at ii. *See also* NASA Comments at 8 (noting that the generally performance-based requirements of the NASA Standard have held up well over time).

⁸⁴ *See e.g.* SpaceX Comments at 9-12; Boeing Comments at 7; Boeing Feb. 14, 2020 *Ex Parte* at 5-6.

⁸⁵ In some cases we provide the opportunity for applicants to use other software programs, for example, provided that those programs are of equal or higher fidelity. For example, NASA has the Debris Assessment Software, capable of calculating collision risk, casualty risk, etc., and available at no cost, but there are higher fidelity tools as well. Other organizations like the European Space Agency also have well-established software tools. *See* European Space Agency, "ESA makes space debris software available online" (June 25, 2014), https://www.esa.int/Safety_Security/Space_Debris/ESA_makes_space_debris_software_available_online.

metric, where for now we will assess issues on a case-by-case basis. We also seek comment on adopting more quantitative rules in certain areas in the Further Notice of Proposed Rule Making. Finally, we note that a number of commenters (generally those operators planning large NGSO constellations), expressed concern as a general matter about metrics being applied on an aggregate basis to a constellation of NGSO satellites.⁸⁶ We address these concerns in connection with individual rules, including whether in particular cases the Commission needs to consider the full factual scenario relevant to a licensing decision, including understanding of the complete scope of the risk involved with the proposed operations.

30. In our recent order adopting elective streamlined licensing procedures for qualifying small satellites, the Commission noted that the qualification criteria that we were adopting would be modified as necessary or appropriate to conform to rules adopted in this orbital debris proceeding.⁸⁷ Accordingly, in several areas of our decision here, we adopt conforming rules for small satellites that file applications under those elective streamlined procedure.⁸⁸ In addition, unless specified otherwise, the rules discussed below will apply to amateur satellites authorized under the procedures specified in part 97 of the Commission's rules and experimental satellites authorized under the procedures specified in part 5 of the Commission's rules.

31. One party, Public Employees for Environmental Responsibility, filed a comment in this docket arguing that the Commission has a responsibility to consider the safety of substances used in satellite construction and operation and environmental issues associated with such operations.⁸⁹ Public Employees for Environmental Responsibility proposes that the Commission require review of technical specifications of satellites being launched and in particular to review the proposed use of toxic fuels as propellants.⁹⁰ Public Employees for Environmental Responsibility does not raise specific questions, or make specific proposals, regarding the orbital debris rules proposed in the *Notice*, and the issues it raised thus fall outside the scope of this proceeding.

B. Safe Flight Profiles

32. Our existing orbital debris rules include several disclosure requirements designed to ensure that operators are addressing the issue of potential collisions with debris or other objects.⁹¹ We update our rules on safe flight profiles to specify metrics that NASA applies to its missions, and adopt additional disclosures relating to orbital characteristics and maneuverability. We also seek comment on some additional issues as part of the Further Notice below.

1. Collisions with Large Objects

33. In the *Notice*, the Commission proposed that applicants for NGSO satellites must state whether the probability that their spacecraft will collide with a large object during the orbital lifetime of the spacecraft will be less than 0.001 (1 in 1,000).⁹² The current NASA Standard defines a "large object"

⁸⁶ See, e.g., Boeing Comments at 10-11; Telesat Canada Comments at 3 (rec. April 5, 2019) (Telesat Comments); SpaceX Comments at 14-16; Amazon.com, Inc. Reply Comments at 2-3 (rec. May 6, 2019) (Amazon Reply).

⁸⁷ *Small Satellite Order*, 34 FCC Rcd at 13084, para. 20.

⁸⁸ *Id.* at para. 20.

⁸⁹ See Letter from Kevin H. Bell, Staff Counsel, Public Employees for Environmental Responsibility to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313 (filed Nov. 19, 2018). The letter was filed prior to the publication of the *Notice* in the Federal Register.

⁹⁰ *Id.* at 2.

⁹¹ See 47 CFR § 25.114(d)(14)(i), (iii).

⁹² *Notice*, 33 FCC Rcd at 11361, para. 26.

as an object larger than 10 cm in diameter.⁹³ To date, many applicants have used NASA's Debris Assessment Software to conduct the analysis for LEO spacecraft.

34. Most commenters addressing this issue supported our proposal,⁹⁴ and we adopt it. Some commenters appear to have misunderstood this proposal, believing that the proposal was to require a specific threshold for maneuvers in individual instances of predicted conjunctions, for example.⁹⁵ The particular metric adopted is intended to address the overall collision risk of a satellite during its orbital lifetime, and not individual conjunction events. In preparing the risk assessment, applicants should use the latest version of the NASA Debris Assessment Software or a higher fidelity assessment tool.⁹⁶

35. In the *Notice*, the Commission also sought comment on whether, for purposes of conducting the analysis, and absent evidence to the contrary, the collision risk with large objects should be assumed zero or near zero during the period of the time when the space station is able to conduct collision avoidance maneuvers.⁹⁷ Several commenters agreed with this approach.⁹⁸ A number of commenters pointed out that this requires an assumption that maneuvering systems are 100% reliable,⁹⁹ and some suggested instead incorporating the probability thresholds at which operators undertake collision avoidance maneuvers into the overall assessment of collision risk.¹⁰⁰ Those thresholds vary among operators, but are typically at lower probabilities than the 0.001 metric as applied through the NASA Debris Assessment Software.¹⁰¹ As a simplifying assumption,¹⁰² we believe the alternative

⁹³ NASA Standard, 4.5.2, at 36 (Requirement 4.5-1). Similar to the NASA Standard, the revised ODMSP states that “a program will estimate and limit the probability of collision with objects 10 cm and larger during orbital lifetime to less than 0.001 (1 in 1,000).” ODMSP, 2-1.

⁹⁴ See, e.g., Boeing Comments at 6, 10; The Commercial Smallsat Spectrum Management Association (CSSMA) Comments at 7 (rec. April 5, 2019) (CSSMA Comments); ORBCOMM Inc. Comments at 7 (rec. April 5, 2019) (ORBCOMM Comments); The Commercial Smallsat Spectrum Management Association Reply Comments at 4 (rec. May 6, 2019) (CSSMA Reply).

⁹⁵ See, e.g., Intelsat Comments at 8.

⁹⁶ This clarification should address those commenters requesting that the Commission specify a standardized tool for assessment, see, e.g. University Small-Satellite Researchers Comments at 14-15 (rec. April 5, 2019), as well as clarify that the “large object” assessment must include objects greater than 10 centimeters in diameter, consistent with the current NASA Standard and Debris Assessment Software. See NASA DAS 3.0 User's Guide, 3.4, at 24-25; NASA Standard at 4.5.1.2 (“For purposes of evaluation, debris with a diameter of 10 cm or larger will be assumed to cause a catastrophic collision.”). See also NASA Comments at 3 (use of 10 cm as a large-object threshold is appropriate; The Aerospace Corporation Comments at 8 (rec. Mar. 7, 2019) (Aerospace Comments) (supporting definition of large objects as those of size greater than 10 cm); Boeing Comments at 11-12 (suggesting that the Commission adopt the NASA Standard definition of a large object). LeoSat MA, Inc. (LeoSat) and state that the Commission should not adopt a specific size for a “large object,” see LeoSat MA, Inc. Comments at 3 (rec. April 5, 2019) (LeoSat Comments); Intelsat Comments at 8-9, but we find it reasonable to adopt NASA's approach to this issue, which is reflected in the NASA Debris Assessment Software.

⁹⁷ *Notice*, 33 FCC Rcd at 11361-62, para. 26.

⁹⁸ See Boeing Comments at 12 (supporting the treatment of any spacecraft that is maneuverable as posing zero or near zero risk of collision with large objects); SES Americom, Inc. and O3b Limited Comments at 1-2 (rec. April 5, 2019) (SES/O3b Comments) (urging Commission to incorporate the current presumption that the risk is effectively zero for operators able to maneuver their spacecraft to avoid a collision).

⁹⁹ OneWeb Comments at 16; CSSMA Comments at 8-9; Iridium Communications Inc. Comments at 3 (rec. April 5, 2019) (Iridium Comments); CSSMA Reply at 6; Tyvak Reply.

¹⁰⁰ See, e.g., Aerospace Comments at 8 (Air Force standards specify 1×10^{-6} as a risk threshold for triggering avoidance maneuvers).

¹⁰¹ See *id.*

assumption of zero is warranted.¹⁰³ However, in individual cases, to the extent there is evidence that a particular system or operator is unable to effectively maneuver or is maneuvering only at risk thresholds that raise reasonable questions about its ability to meet the 0.001 collision risk metric even with some degree of maneuverability, this assumption will not be applied.¹⁰⁴

36. *Systems with Multiple Space Stations.* In the *Notice*, the Commission also sought comment on the assessment of the collision risk presented by a system as a whole, i.e., in the aggregate.¹⁰⁵ Commenters expressed a variety of views on assessing probability of collision with large objects on a system-wide basis, including on what specific metrics, if any, should apply.¹⁰⁶ Additionally, subsequent to the *Notice*, the revised ODMSP was issued, which includes a section discussing “large constellations,” and states that “in determining the successful post-mission disposal threshold [for large constellations], factors such as mass, collision probability, orbital location and other relevant parameters should be considered.”¹⁰⁷ As described in the Further Notice below, we seek to develop the record further on this issue and how to address multi-satellite systems, including large constellations.

37. *GSO Satellites.* The Aerospace Corporation (Aerospace) suggests that we apply the requirement to GSO satellites as well as NGSO satellites, because GSO satellites can also be involved in collisions that would generate large amounts of un-trackable, long-term debris in the geostationary orbit (GEO) region.¹⁰⁸ In the *Notice*, the Commission proposed inclusion of the metric into the disclosure specifically for NGSO satellites.¹⁰⁹ The NASA Standard formulation discussed in the *Notice* applies to

(Continued from previous page) _____

¹⁰² NASA observes that the inclusion of collision avoidance threshold into the overall assessment of collision risk is a difficult technical problem. NASA Comments at 2-3. NASA would ideally include not only the type of collision risk threshold specified by Aerospace, but also account for other aspects of on-orbit collision avoidance residual risk. *Id.* NASA observes that historically a satellite’s posture to performing on-orbit collision avoidance has either been not considered or presumed to reduce to zero the risk of collision during the satellite’s active mitigation period. *Id.* Despite some drawbacks to these approaches, NASA appears to agree with a historical approach for the time being, and notes that the NASA is just beginning to work on how to derive an omnibus risk value that accurately reflects the on-orbit collision avoidance portion of a satellite’s lifetime. *Id.* NASA recommends that the Commission update its rules to include a more comprehensive understanding and apportionment of risk once a comprehensive approach is available. *Id.*

¹⁰³ Other commenters appeared to believe the FCC proposal was to require that, in individual conjunction events, collision avoidance must be undertaken in order to reduce the collision probability entirely to zero, regardless of whether the predicted probability of collision was extraordinarily low. This was not the intent of the FCC proposal.

¹⁰⁴ In an *ex parte* filing, Viasat argues for taking into account expected adequacy of proposed collision avoidance capabilities in every case, noting that the effectiveness of maneuverability systems depends on a number of factors. *See* Letter from John P. Janka, Chief Officer, Global Government Affairs & Regulatory, Viasat, Inc., to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, Attach. 1 at 2, Attach. 2 (filed April 10, 2020) (Viasat Apr. 10, 2020 *Ex Parte*). To the extent that Viasat’s suggestions relate to multi-satellite constellations, we address them in the Further Notice.

¹⁰⁵ *Notice*, 33 FCC Rcd at 11362, para. 26. *See also id.* at 11397, Appendix A, Proposed Rules.

¹⁰⁶ Additionally, Telesat suggests that the Commission should “pro-rate” collision risk metrics, in order to incentivize deployment of satellites with longer missions rather than replenishment of shorter-lived satellites, including by increasing the risk metric for satellites with a longer service life. Telesat Comments at 3. To the extent that Telesat suggests that the probability of collision metric should consider numbers of satellites in a particular system, we address these matters in the Further Notice below.

¹⁰⁷ *See* ODMSP, 5-1.

¹⁰⁸ Aerospace Corporation Comments at 8.

¹⁰⁹ *See Notice*, Appendix A, Proposed Rules, § 25.114(d)(14)(iv)(A)(1).

“each spacecraft and launch vehicle orbital stage in or passing through LEO.”¹¹⁰ Currently, all space station applicants, including applicants for GSO space stations, must provide a statement that the space station operator has assessed and limited the probability of the space station becoming a source of debris by collisions with large debris or other operational space stations. We believe that continuing to apply this disclosure approach to applicants for GSO systems is sufficient, without needing to adopt a specific metric at the current time. We encourage GSO operators to provide quantitative collision risk information, but believe that requiring such analysis as part of the initial application materials is unnecessary,¹¹¹ given that GSO operators are assigned to particular orbital locations, including a specific “station keeping box,”¹¹² and must comply with certain well-established disposal procedures.¹¹³

2. Collisions with Small Objects

38. In the *Notice*, the Commission sought comment on adding a quantifiable metric to our existing rules regarding the probability of a space station becoming a source of debris by collisions with small debris or meteoroids that could cause loss of control and prevent post-mission disposal.¹¹⁴ The *Notice* referenced the NASA Standard, which states that for each spacecraft, the program or project shall demonstrate that, during the mission of the spacecraft, the probability of accidental collision with orbital debris and meteoroids sufficient to prevent compliance with the applicable post-mission disposal maneuver requirements does not exceed 0.01 (1 in 100).¹¹⁵ The revised ODMSP includes a similar provision.¹¹⁶ Our current rules require a statement that operators (both GSO and NGSO) have assessed and limited the probability of the satellite becoming a source of debris by collisions with small debris or meteoroids that could cause loss of control or prevent post-mission disposal.¹¹⁷ Generally, operators have provided information regarding spacecraft shielding, redundant systems, or other designs that would enable the spacecraft systems to survive a collision with small debris. Some operators have been providing the information specified in the NASA Standard, calculated using the NASA Debris Assessment Software.

39. Most commenters addressing this issue agreed with the inclusion of the NASA Standard-derived metric in our rules. NASA notes that this particular agency requirement, when applied to NASA missions, has been achievable and cost-effective with shielding, use of redundant systems, or other design or operational options.¹¹⁸ OneWeb disagrees with the inclusion of a separate small object collision metric,

¹¹⁰ NASA Standard, 4.5.2, at 36 (Requirement 4.5-1). Aerospace suggests that we limit the period of assessing collision probability to a finite time such as 100 years. Aerospace Comments at 8. We decline to adopt this into our rules, since we are not adopting a specific metric for GSO space stations. However, NGSO space stations not disposed of through atmosphere re-entry, i.e. space stations in medium-Earth orbit (MEO) may refer to this 100-year outer limit in implementing the collision risk assessment. See ODMSP 3-1.

¹¹¹ The Commission may request such analysis if there is an application for a particularly unique type of operation in the GEO region, or there is evidence to suggest that certain GSO operations may pose unique risks to the GEO environment.

¹¹² See 47 CFR § 25.210(j) (space stations operated in the geostationary satellite orbit must be maintained within 0.05 degrees of their assigned orbital longitude in the east/west direction, unless specifically authorized otherwise); 47 CFR §25.114(d)(14)(iii) (GSO applicants must disclose if there are any known satellites at the vicinity of the requested GEO location, such that the station keeping volumes of the respective satellites might overlap).

¹¹³ See 47 CFR § 25.283(a).

¹¹⁴ *Notice*, 33 FCC Red at 11362, para. 27.

¹¹⁵ See *id.*; NASA Standard, Requirement 4.5-2, at 36.

¹¹⁶ ODMSP at 3-2. The ODMSP identifies micrometeoroids and orbital debris smaller than 1 cm. *Id.* As noted, an assessment performed using the NASA Debris Assessment Software will satisfy our rule.

¹¹⁷ 47 CFR § 25.114(d)(14)(ii).

¹¹⁸ NASA Comments at 3.

on the basis that the Commission should adopt a comprehensive deorbit reliability metric that accounts for all failure modes.¹¹⁹ In our view, adoption of this small object collision metric, along with the disposal reliability metric discussed below, sufficiently addresses potential satellite failure modes, because it takes into consideration both failures due to collisions with small debris and other potential sources of failure for post-mission disposal. We conclude that incorporating the NASA Standard-derived metric into our rules for NGSO applicants is in the public interest as it provides more certainty for operators regarding an acceptable disclosure of risk specifically related to collisions with small objects. We conclude that the benefits of this approach are worth the efforts of operators in performing an additional calculation in preparation of their orbital debris mitigation plan, because this calculation may be completed using the NASA Debris Assessment Software or a comparable or higher fidelity assessment tool, and many applicants already conduct this assessment.¹²⁰

40. We conclude that applicants for GSO space station will also be required to include a disclosure related to this metric. In the *Notice*, the Commission had proposed to add this metric to our rules for both NGSO and GSO space stations,¹²¹ but we received several comments suggesting that inclusion of this metric into our rules for GSO space stations would be of limited utility.¹²² One of the commenters, Boeing, seems to have changed its view on this point in supplemental comments.¹²³ Additionally, while Eutelsat suggests that the risks posed to GSO satellites in this area are materially lower than the risks posed to NGSO satellites,¹²⁴ we do not see this as a reason not to apply the metric in our rules for GSO spacecraft, since it should be easier for those spacecraft to satisfy the rule. Accordingly, we adopt our proposal.

3. Disclosures Regarding Planned Orbit(s)

41. *Identification of Other Relevant Satellites and Systems.* In the *Notice*, the Commission sought comment on revising the wording of its rule regarding identifying other space stations that are operating in similar or identical orbits in low-Earth orbit.¹²⁵ The Commission proposed revising the rule to require that, instead of identifying satellites with similar or identical orbits, the statement must identify planned and/or operational satellites with which the applicant's satellite poses a collision risk, and indicate what steps have been taken to coordinate with the other spacecraft system and facilitate future coordination, or what other measures the operator may use to avoid collisions.¹²⁶ The Commission also proposed to extend this rule to all NGSO satellites, rather than just those that will be launched into the LEO region,¹²⁷ since overlap in orbits among NGSO spacecraft in other regions may also result in collisions.¹²⁸ Several commenters supported these revisions,¹²⁹ and we adopt them.¹³⁰ As part of the

¹²⁶ *Id.* at 11363, para. 28.

¹²⁷ The current rule only applies to those space stations that are launched into the LEO region. See 47 CFR § 25.114(d)(14)(iii).

¹²⁸ *Id.*

public record, this disclosure can also help to inform other operators that may be operating or plan to operate in the same region of space. Since this wording is similar to the previous rule, we find that there are unlikely to be significant additional costs from compliance with this disclosure requirement,¹³¹ but to the extent there are any additional costs in research and assessment of the environment in which the spacecraft will be located, we conclude they are warranted in the interest of ensuring that operators take into consideration other relevant space stations and systems when preparing orbital debris mitigation plans, and coordinate with those operators when necessary.¹³²

42. CSSMA and LeoSat oppose a requirement that the collision analysis include analysis with respect to planned systems, arguing that planned systems change frequently and not all systems are known.¹³³ We clarify that the rule will require a disclosure identifying potential systems of concern, but does not require that the applicant's calculated collision risk include such systems (which would go beyond what can be assessed using the NASA Debris Assessment Software). It is important, however, that applicants assess planned systems, what impact such systems may have on their operations, and what coordination can be completed with the operators of such systems. While not all planned systems may come to fruition and there may be systems that would be unknown to applicants, such as foreign or government systems, we expect applicants to make best efforts to analyze the environment in which their satellites will be operating¹³⁴ and specify how they plan to coordinate, to the extent possible, with other operators to ensure safe operations. Boeing asks that we clarify that the disclosure must specify only those other NGSO satellite systems "the normal operation of which" pose a risk of collision.¹³⁵ We concur with Boeing's clarification of the rule, but decline to change the rule language since we believe that it is self-evident that an operator can only take into consideration the planned or normal operations of another operator's system.

43. *Orbit Selection and Other Orbital Characteristics.* In the *Notice*, the Commission also proposed that any applicants planning an NGSO constellation that would be deployed in the LEO region above 650 km in altitude specify why the applicant had chosen the particular orbit and describe other relevant characteristics of the orbit.¹³⁶ The Commission reasoned that missions deploying above 650 km altitude may represent a greater risk from a long-term orbital debris perspective, since satellites that fail above that altitude will generally not re-enter Earth's atmosphere within 25 years, and depending on the deployment altitude, may be in orbit for centuries or longer.¹³⁷ The Commission also sought comment on

(Continued from previous page) _____

¹²⁹ See, e.g., ORBCOMM Comments at 8; Global NewSpace Operators Comments at 7; Boeing Comments at 13-14; OneWeb Comments at 7; SES/O3b Comments at 3. See also Iridium Comments at 3 (supporting the disclosure and requesting that to the extent that a proposed satellite system would pose an unreasonable collision risk to existing satellite constellations, the applicant should be not be granted authority to operate).

¹³⁰ We also adopt a conforming rule that is applicable to applicants for the streamlined small satellite process in section 25.122 and streamlined small spacecraft process in section 25.123. See Appendix A, Final Rules.

¹³¹ While this does represent a new disclosure for applicants for NGSO space stations that would operate above LEO, as a practical matter there are typically few other systems that pose a collision risk at those altitudes, and so this should represent a minimal cost, if any, for those NGSO applicants.

¹³² See, e.g., NASA Comments at 3 (recommending that coordination and other measures the operator plans to use to avoid collision be done over the orbital lifetime of the proposed space station).

¹³³ LeoSat Comments at 3; CSSMA Comments at 9; CSSMA Reply at 6.

¹³⁴ Applicants may be able to assess planned systems based on filings with the Commission or International Telecommunication Union (ITU). We expect applicants to identify planned systems on a "best efforts" basis.

¹³⁵ Boeing Comments at 14.

¹³⁶ *Notice*, 33 FCC Rcd at 11364, para. 31.

¹³⁷ *Id.*

whether it should require a statement concerning the rationale for selecting an orbit from operators of satellites that will remain in orbit for a long period of time relative to the time needed to perform their mission.¹³⁸

44. After review of the record, we decline to adopt these proposals.¹³⁹ We conclude after further consideration that the long-term risks associated with deployments above 650 km are sufficiently addressed through our other rules, such as collision risk assessment, and reliability of post-mission disposal and that therefore the additional statement is not necessary. Indeed, application of the Commission's other orbital debris mitigation rules may in some instances result in an operator deciding to deploy below 650 km.¹⁴⁰ While SpaceX, for example, supported the proposed disclosure regarding rationale for selecting a particular orbit,¹⁴¹ we conclude that concerns the Commission may have about risks associated with operations in a particular orbit can be adequately addressed through other measures addressed in this proceeding.

45. We do adopt our proposal, however, that NGSO systems disclose information regarding other relevant characteristics of the chosen deployment orbit not already covered, such as the presence of a large concentration of existing debris in a particular orbit.¹⁴² Boeing states that the Commission should not adopt regulation in this area, because operators are adequately incentivized to select initial orbits that are sufficiently free of hazards, or invest in other measures to facilitate the safety of their satellites.¹⁴³ We find that this disclosure will help to ensure that operators have considered all the characteristics of the deployment and operational orbits, and are fully aware of the risks associated with operations in the particular orbit.¹⁴⁴ This may not always be the case, particularly with smaller operators or operators who use a rideshare launch. If an orbit is particularly congested with debris, for example, an operator may

¹³⁸ *Id.* at 11365, para. 32. The Commission gave the example of a technology demonstration mission in LEO that last only a few weeks resulting in up to 25 years of collision risk to other operators. *Id.*

¹³⁹ Several operators suggest that applicants should not be required to justify their orbit selection. Among these, CSSMA notes that if an applicant complies with collision risk thresholds, the Commission should consider its collision risk analysis to be sufficiently informative and not require any additional justification for operations above 650 km. CSSMA Comments at 8. Boeing states that the Commission should not involve itself in the business and technical considerations regarding selection of a particular orbit. Boeing Comments at 16.

¹⁴⁰ While LeoSat supported the disclosure proposal on this point, we believe it can be addressed more effectively by other rules. *See* LeoSat Comments at 4.

¹⁴¹ *See* SpaceX Comments at 19-20 (applicants planning to deploy a system at any altitude should specify why they have chosen that particular orbit, and include characteristics of the planned constellation). Iridium also supported the proposed disclosure, suggesting that applicants seeking to operate between 400 km and 2,000 km provide the disclosure. Iridium Comments at 6.

¹⁴² *See Notice*, 33 FCC Rcd at 11364-65, paras. 31, 33 (discussing disclosure of relevant orbital characteristics and discussing selection of orbits with presence of significant debris population); *see* Appendix A, Final Rules. *See also, e.g.*, McKnight Comments at 3 (stating that there are clusters of massive derelicts in LEO at particular altitudes that present unique and significant debris-generating potential); Iridium Comments at 6 (supporting a disclosure regarding the existence of known sources of debris in or nearby the applicant's proposed orbit).

¹⁴³ Boeing Comments at 18. *See also* Telesat Comments at 5 (with regard to operations in higher debris regions, an applicant seeking authorization to operate in such a region will necessarily need to account for this debris in demonstrating compliance with the collision risk metrics, and as a result, additional restrictions on operating in more populated areas of space are unnecessary).

¹⁴⁴ *See* ORBCOMM Comments at 10 (disagreeing with a ban on deployments into areas where debris is particularly dense, but supporting a disclosure requirement specifying assurances on how an applicant plans to reduce risks associated with areas of higher collision risk).

want to consider modifying its operations slightly to avoid having to perform a large number of collision avoidance maneuvers.¹⁴⁵

4. Orbit Variance and Orbit Selection for Large NGSO Systems

46. The *Notice* sought comment on whether the Commission should adopt an upper limit for variances in orbit for NGSO systems.¹⁴⁶ “Variance” refers to the range of altitude, such as “1025 km plus or minus 10 km,” in which a satellite or constellation of satellites will operate. The Commission asked whether variance in altitude should be limited in an NGSO system in order to enable more systems to co-exist in LEO without overlap in orbital altitude, and if so, how an appropriate limit should be set.¹⁴⁷ We received a number of comments related to orbital variance for large NGSO systems, and even more comments on the related topic of whether, and how, the Commission should assign orbital altitude ranges for large constellations of NGSO satellites, such that the altitudes do not overlap.¹⁴⁸

47. The question of whether two satellite systems can coexist in a given region of space, such as a circular LEO orbit, depends on multiple factors, including the number and size of satellites, the capabilities of the satellites such as maneuverability, costs of maneuvering (such as interruption of service), availability and timeliness of data on satellite parameters (both from telemetry and from radar or optical observations), planning cycles for maneuvers, and the time required to coordinate operations between systems, etc. Larger deployments of satellites into circular LEO orbits have been into separate orbital “shells.” As a practical matter, in cases where two planned systems propose use of the same shell, coordination typically results in one or both systems adjusting planned orbital altitudes, so that the constellations are separated, rather than in the operators coordinating their operations at the same or overlapping altitude ranges. While some commenters urge that we adopt specific requirements for separation of orbits,¹⁴⁹ others argue that coordination, data sharing, and collision avoidance practices should be sufficient to avoid collisions, or that limits are not practicable for the regions in which some operators operate, particularly small satellite operators.¹⁵⁰ ORBCOMM states that the operational availability of NGSO orbits appears likely to become an increasingly scarce resource, but states that it is premature to try and set rules on maximum altitude variance and orbit selections.¹⁵¹ Other commenters argue, particularly with respect to systems proposing large orbital variances, that the Commission must consider the impact of such systems on the rational, efficient, and economic use of orbital resources.¹⁵² At

¹⁴⁵ NASA notes that depending on how early an operator begins the licensing process, it may be too late for operators to redesignate their orbital destination, and so this assessment would be better performed and approved early in an operator’s design/development phase. *See* NASA Comments at 1, 4. We agree that analysis of the planned orbit(s) should occur as early as possible, to avoid a situation in which an operator must change its planned orbit at a later stage.

¹⁴⁶ *Notice*, 33 FCC Rcd at 11365, para. 35.

¹⁴⁷ *Id.*

¹⁴⁸ *See, e.g.*, LeoSat Comments at 4; Iridium Comments at 4; McKnight Comments at 3; Boeing Comments at 21; OneWeb Comments at 3-7. *See also* Letter from Bryan N. Tramont, Counsel to Iridium Communications Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, Attach. at 4-5 (filed Apr. 16, 2020) (Iridium *Ex Parte* Letter).

¹⁴⁹ *See, e.g.*, OneWeb Comments at 4-6, Iridium Comments at 4.

¹⁵⁰ Telesat Comments at 5. *See also* CSSMA Comments at 10 (arguing that orbital separation and orbital variance are not practicable for small satellite operators).

¹⁵¹ ORBCOMM Comments.

¹⁵² *See, e.g.*, Boeing Comments at 20-21. Boeing states that the ITU Constitution requires the consideration of limits on orbital variances, because Article 44 states that ITU Members States shall bear in mind that orbital resources “are limited natural resources” that must be used “rationally and efficiently, and economically.” *Id.* (Citing ITU Constitution, Art. 44).

this time, we decline to adopt a maximum orbital variance for NGSO systems and decline to adopt a required separation between orbital locations, and will instead continue to address these issues case-by-case. There are a wide range of considerations in such cases, and while we are concerned about the risk of collisions between the space stations of NGSO systems operating at similar orbital altitudes, as the Commission has previously stated, we think that these concerns are best addressed in the first instance through inter-operator coordination.¹⁵³

48. As part of the disclosure of system characteristics, we note that some applicants for large systems may be asked to provide a description of the planned orbital variance, and the relationship of that variance to the system's technical capabilities and operational requirements (e.g., ability to avoid collisions). Such applicants may also need to address how their system operations will accommodate spacecraft transiting through the system and other systems, large or small, operating in the same region. If operators require a large orbit variance for their system, particularly if this might substantially constrain operations by other systems, they should plan to describe why and explain whether other less impactful alternatives were considered.

5. Protection of Inhabitable Spacecraft

49. The Commission proposed in the *Notice* that for any NGSO space station deployed above the International Space Station (ISS) and that will transit through the ISS orbit either during or following the space station's operations, the applicant provide information about any operational constraints caused to the ISS or other inhabitable spacecraft¹⁵⁴ and strategies used to avoid collision with such spacecraft.¹⁵⁵ The Commission explained that normal operations of the ISS could be disrupted or constrained by collision avoidance maneuvers that the ISS would need to perform to avoid satellites transiting through the ISS orbit.¹⁵⁶

50. We conclude that it is in the public interest to adopt the proposed disclosure requirement.¹⁵⁷ The statement must describe the design and operational strategies, if any, that will be used to minimize the risk of collision and enable the operator to avoid posing any undue operational constraints to the inhabitable spacecraft. Commenters agree that special protections should be afforded to inhabitable spacecraft.¹⁵⁸ We find that requiring this information will help to ensure that the applicant has taken into consideration the inhabitable spacecraft, and will provide information in the public record to help the Commission and other interested parties, such as NASA, determine if there are any potential issues with the applicant's operations vis-à-vis the ISS or other inhabitable spacecraft. NASA states that disruption to ISS operations may be lessened if a spacecraft in the process of disposal through

¹⁵³ *Space Exploration Holdings, LLC*, Memorandum Opinion, Order, and Authorization, IBFS File No. SAT-LOA-20161115-00118, 33 FCC Rcd 148, at para. 11 (2018). See also Letter from Brian D. Weimer, Counsel to WorldVu Satellites Limited, and Bruce A. Olcott, Counsel to The Boeing Company, to Marlene H. Dortch, Secretary, FCC, IBFS File Nos. SAT-LOI-20160428-00041, SAT-LOA-20160622-00058 (Mar. 23, 2017) (letter indicating that Boeing was planning to alter the orbital altitude of its then-proposed constellation following discussion with OneWeb on maintaining sufficient orbital separation between two constellations).

¹⁵⁴ We use the term "inhabitable spacecraft" to mean any spacecraft capable of having crew aboard. Secure World Foundation points out that there may be additional human-occupied spacecraft on orbit in the coming years, and supports requirements that take these additional spacecraft into consideration. Secure World Foundation Comments at 4.

¹⁵⁵ *Notice*, 33 FCC Rcd at 11363-64, para. 30.

¹⁵⁶ *Id.*

¹⁵⁷ This includes transit either during the applicant space stations' mission or de-orbit phase. See Appendix A, Final Rules.

¹⁵⁸ See, e.g., OneWeb Comments at 11; SpaceX Comments at 7.

atmospheric reentry remains active and able to maneuver until the apogee is below ISS altitude.¹⁵⁹ We conclude that the benefits in assuring the safety of human life in space and minimizing disruption to the operations of inhabitable spacecraft outweighs any additional cost to applicants in preparing such a disclosure.

6. Maneuverability

51. *Disclosure.* Maneuverability can be an important component of space debris mitigation, both by enabling space stations to engage in collision avoidance and by facilitating spacecraft disposal. The Commission proposed in the *Notice* that applicants disclose the extent of maneuverability of the planned space stations.¹⁶⁰ The Commission noted that this could include an explanation of the number of collision avoidance maneuvers the satellite could be expected to make, and/or any other means the satellite may have to avoid conjunction events, including the period both during the satellite's operational lifetime and during the remainder of its time in space prior to disposal.¹⁶¹ The Commission tentatively concluded that this information could assist in the Commission's public interest determination, particularly regarding any burden that other operators would have to bear in order to avoid collisions and false conjunction warnings.¹⁶² Most commenters addressing this topic agree with the maneuverability disclosure,¹⁶³ and we adopt this disclosure.

52. LeoSat disagrees with the proposal, arguing that specific information related to satellite maneuverability is proprietary and competitive in nature, that public disclosure of this information as part of an application could prompt a "race to the bottom" among satellite operators, and that any information initially disclosed in an application will become stale and inaccurate as the operator's satellites age and their propulsion capacity is consumed.¹⁶⁴ It does not appear that LeoSat has support among fellow satellite operators for its proposition that satellite maneuverability information is proprietary and competitive.¹⁶⁵ Further, even if such information has some potential "competitive" value, such information would likely need to be shared with another operator in the event of a potential conjunction, and all operators will be better able to make informed decisions if they have a baseline understanding of the maneuvering potential of other satellites in orbit. Moreover, it is not clear to us how disclosure would cause a "race to the bottom," and even if information became outdated as some spacecraft were no longer able to maneuver, having initial information on what capabilities the satellites were designed with could still assist the Commission in its review of the system and also assist other operators. We find that the benefits of having information regarding maneuverability as part of the record outweigh these commenters' generalized competitive concerns.¹⁶⁶ Boeing also disagrees in some respects with the proposed disclosure on the basis that the Commission has not provided guidance on the number of avoidance maneuvers that would be presumptively deemed acceptable.¹⁶⁷ We plan to consider the

¹⁶⁴ LeoSat Comments at 5.

¹⁶⁵ *See* CSSMA Reply at 10 (stating that it does not believe that just revealing the category of maneuverability of all space stations will disadvantage any applicant significantly).

¹⁶⁶ *Id.*

¹⁶⁷ Boeing Comments at 23. Boeing states that the Commission should not use the information to withhold or condition the authorization of any NGSO system, at least until the satellite industry and the Commission gain more experience regarding the frequency and reliability of collision avoidance techniques. Boeing Comments at 24.

maneuverability disclosure as factual information, and at this time do not establish a presumptive number of avoidance maneuvers that would trigger concern.¹⁶⁸ We believe that on balance, this area is an appropriate one for a disclosure and provides useful information, including to other operators. We encourage operators to submit as much information as they reasonably can regarding maneuverability, ideally providing the type of information mentioned by NASA in its comments, including maneuver methods and capabilities, as well as any other mechanisms to mitigate conjunction likelihood (e.g., cross-sectional area modulation).¹⁶⁹ This would also include information regarding the propulsive technology itself (i.e., ion thrusters, traditional chemical thrusters, etc.), thrust level, and a description of the guidance and operations scheme for determining maneuvers, where applicable. Generally speaking, operators should submit a written description of the space stations' expected capabilities, including, if possible, the expected time it would take the space station to modify its orbital location by a certain distance to avoid a collision.¹⁷⁰

53. *Propulsion or Maneuverability Above a Certain Altitude.* The Commission also sought comment in the *Notice* on whether it should require all NGSO satellites planning to operate above a particular altitude to have propulsion capabilities reserved for station-keeping and to enable collision avoidance maneuvers, regardless of whether propulsion is necessary to de-orbit within 25 years, and if so, what altitude should be adopted.¹⁷¹ A number of commenters supported some requirement along these lines, with some identifying 400 km as an altitude above which propulsion or other maneuvering capabilities should be required, generally based on the approximate operational altitude of the ISS.¹⁷² Other commenters disagreed with this suggestion. We seek to expand the record on this potential requirement in the Further Notice below.

C. Tracking and Data Sharing

54. In the *Notice*, the Commission observed that the successful identification of satellites and sharing of tracking data are important factors in the provision of timely and accurate assessments of potential conjunctions with other spacecraft.¹⁷³ We continue to believe that improvements in the ability to

¹⁶⁸ In the Further Notice we consider additional issues regarding whether space stations should be required to have maneuverability sufficient to conduct collision avoidance when located above a particular altitude, and how we could assess whether maneuverability is sufficient.

¹⁶⁹ See NASA Comments at 5.

¹⁷⁰ See also OneWeb Comments at 13 (stating that the disclosure should include information detailing the satellite's maneuvering capabilities, including achievable conjunction separation distances based upon decision lead time and the process by which an applicant intends to assess conjunctions and execute required evasive maneuvers).

¹⁷¹ *Notice*, 33 FCC Rcd at 11365, para. 34. The Commission had also asked whether it should adopt this requirement in lieu of some proposed disclosures—such as requiring applicants operating above a certain altitude to justify their choice of orbit, and requiring applicants to provide disclosures regarding orbit selection and assurances on how they plan to reduce risks. *Id.* at 11364-65, paras. 31-33. The Commission also sought comment on whether it should seek additional information or assurances from applicants in certain specific circumstances, such as where they seek to deploy a large constellation in certain sun-synchronous orbits that have an increased likelihood of congestion. *Id.*

¹⁷² See, e.g., Iridium Comments at 6 (stating that applicants planning to deploy NGSO spacecraft above 400 km have a responsibility to maintain custody and control of their spacecraft); OneWeb Comments at 11, 14-15 (operators should demonstrate an ability to control the trajectories of their spacecraft and capability to execute timely and effective collision avoidance maneuvers if they are proposing to operate above the ISS); SpaceX Comments at 8 (operators planning to deploy satellites above and around the ISS should be required to have propulsive capabilities); McKnight Comments at 3-4 (maneuverability should be required for any space system deployed above crewed space stations); Aerospace Comments at 10 (stating that active collision avoidance should be required for any spacecraft that would transit the altitude of a crewed spacecraft); Amazon Reply at 4 (stating that the Commission should heed support in the record for imposing maneuverability standard above 400 km).

¹⁷³ *Notice*, 33 FCC Rcd at 11365, para. 36.

track and identify satellites may help to reduce the risk of collisions. These factors can help to enable effective collision avoidance through coordination between operators, and improve the accuracy of conjunction warnings, whether those warnings are from a public or private entity specializing in space situational awareness and space traffic management. The Commission made several specific proposals in the *Notice* related to trackability, identification, and sharing of tracking data, which are discussed below. We adopt a number of our proposals in this area, while ensuring that our rules provide flexibility for the continued advancement of space situational awareness and space traffic management functions, including any transition of certain activities in the United States to a civilian entity, and the accommodation of non-governmental associations and other private sector enterprises engaged in these functions.

55. We also received several comments addressing improvements to the U.S. space situational awareness and space traffic management functions more generally.¹⁷⁴ In this proceeding, the Commission has not considered other activities related to space situational awareness and space traffic management, such as maintaining a comprehensive catalog of space objects or providing conjunction warnings.¹⁷⁵ These functions as a general matter are well beyond the type of analysis that we have historically addressed through our rules and licensing process, but we suggest that these comments be filed for consideration in the proceeding currently underway in the Commerce Department,¹⁷⁶ if they have not been already, so that the comments can be taken into consideration in that context.

56. Relatedly, the Commerce Department notes that its Request for Information on Commercial Capabilities in Space Situational Awareness Data and Space Traffic Management Services (RFI), issued last year, will have bearing on the Commission's proposals in this proceeding, and asked us to take their RFI into consideration in this proceeding.¹⁷⁷ We have reviewed the comments filed in response to the RFI, and note that in some instances they are the same in part, or similar to comments submitted to the docket file for the instant proceeding. Other comments to the RFI focus on space situational awareness and space traffic management functions, such as development of an open architecture data repository, that are not directly germane to the Commission's proposals.¹⁷⁸

1. Trackability and Satellite Identification

57. *Trackability.* The Commission proposed in the *Notice* to require a statement from an applicant regarding the ability to track the proposed satellites using space situational awareness facilities, such as the U.S. Space Surveillance Network.¹⁷⁹ The *Notice* also proposed that objects greater than 10 cm

¹⁷⁴ See, e.g., CSSMA Comments at 14-15; Secure World Foundation Comments at 3; Association of Space Explorers Comments at 2-3; Keplerian Tech Comments at 9-11.

¹⁷⁵ Although a small number of commenters supported an expanded role for the FCC, including in coordination of space traffic management efforts, other commenters stated that the FCC should not take on a prominent role in space traffic management. See, e.g. ORBCOMM Comments at 5.

¹⁷⁶ See Request for Information on Commercial Capabilities in Space Situational Awareness Data and Space Traffic Management Services, Notice and request for comments, 84 FR 14645 (April 7, 2019) (Department of Commerce RFI); Commerce Department Comments at 8-9.

¹⁷⁷ Commerce Department Comments at 8-9.

¹⁷⁸ See, e.g., Response of L3 Applied Defense Solutions to Department of Commerce RFI, posted May 24, 2019 (describing its various capabilities for sensing, analytics, visualization, data sharing, and data management that could be provided through an open architecture); Response of Amazon Web Services, Inc., to Department of Commerce RFI, posted May 24, 2019 (providing information on its capabilities as a cloud services provider to enhance development of an open architecture data repository for space situational awareness/space traffic management data). These comments and others filed in response to the Commerce Department RFI are available at <https://www.regulations.gov/docket?D=DOC-2019-0001>.

¹⁷⁹ *Notice*, 33 FCC Red at para. 36.

by 10 cm by 10 cm in size be presumed trackable for LEO.¹⁸⁰ For objects with any dimension less than 10 cm, the Commission proposed that the applicant provide additional information concerning trackability, which will be reviewed on a case-by-case basis.¹⁸¹

58. Commenters generally support the proposed approach to size as it relates to trackability.¹⁸² NASA recommends that the term “satellite trackability” be interpreted to mean that an object is trackable if, through the regular operation of space situational awareness assets, it can be tracked and maintained so as to be re-acquirable at will, and that the object’s orbital data is sufficient for conjunction assessments.¹⁸³ According to NASA, this will typically mean that the object possesses trackability traits (e.g., sufficient size and radar/optical cross-section) to allow it to be acquired routinely by multiple space situational awareness assets in their regular modes of operation.¹⁸⁴ Several commenters agree that in LEO, a 10 x 10 x 10 cm cube should meet this standard.¹⁸⁵ We agree, and adopt the proposed rule stating that space stations of this size in LEO are deemed presumptively trackable, modified slightly to cover space stations that are 10 cm or larger in their smallest dimension.¹⁸⁶ We clarify that this presumption covers those space stations that are 10 cm or larger in their smallest dimension excluding deployable components.¹⁸⁷

59. CSSMA proposes that the Commission require applicants to simply certify that they can be tracked reliably by widely available tracking technology.¹⁸⁸ Swarm similarly suggests that the rules permit smaller satellite form factors pursuant to an affirmative demonstration that such spacecraft can be accurately tracked, and that size should be merely one factor in assessing trackability.¹⁸⁹ Although there may be future improvements in standard space situational awareness tracking facilities,¹⁹⁰ at this time we believe it is in the public interest to adopt the presumed trackable approach for space stations in LEO larger than 10 cm in the smallest dimension, and for other cases, including where a satellite is planning to use deployable devices to increase the surface area, we conclude that operators should provide more information to support their conclusion that the space station will be reliably trackable. For a spacecraft smaller than 10 cm x 10 cm x 10 cm, for example, some of the standard space situational awareness tracking facilities may no longer be able to track the satellite. In these instances, part of a demonstration

¹⁸² See OneWeb Comments at 11-12; Iridium Comments at 7; Boeing Comments at 21. See also University Small-Satellite Researchers Comments at 11 (agreeing with the Commission’s presumed trackability proposal and stating that the Commission should consider an informational disclosure rather than an operational requirement); Aerospace Comments at 11 (stating that requiring trackability is more important than defining size of objects, but stating that the 10 cm tracking size limit can be a rule of thumb, and suggests using a 10 x 10 x 10 cm minimum size for LEO as an exemplar).

¹⁸³ NASA Comments at 4-5.

¹⁸⁴ *Id.*

¹⁸⁵ See, e.g. *id.*; Aerospace Comments at 11; OneWeb Comments at 12.

¹⁸⁶ This would enable a spherical space station, for example, to presumptively satisfy the rule so long as it has a diameter of 10 cm or greater.

¹⁸⁷ Space stations smaller than 10 cm in the smallest dimension, but which will use deployable components to enhance trackability will be analyzed on a case-by-case basis.

¹⁸⁸ CSSMA Comments at 11.

¹⁸⁹ Swarm Reply at 8.

¹⁹⁰ See, e.g. Aerospace Comments at 11 (noting that tracking levels will likely undergo a significant change with the activation of the Space Fence); Swarm Reply at 3-4 (suggesting that implementation of new technologies such as the Space Fence have improved and will continue to improve trackability).

supporting a finding of trackability may be a showing that the operator has taken on the cost of bringing the trackability back up to the level it would be for a larger spacecraft, perhaps by enlisting a commercial space situational awareness provider. CSSMA and others argue that the Commission should permit operators flexibility to choose appropriate solutions,¹⁹¹ and that ground-based space situational awareness capabilities may improve significantly in the future.¹⁹² We find that our approach provides operators with flexibility to satisfy the Commission's rule, because it permits a case-by-case assessment of trackability where the space station is smaller than 10 cm in the smallest diameter. Global NewSpace Operators argues that we should provide further detail on what information we are looking for in the disclosure, for example, to what accuracy and how often should tracking occur, and whether we will ask for verification from the space situational awareness provider that they can indeed track the proposed satellites.¹⁹³ We decline to provide additional detailed guidance in our rules on this topic, as an acceptable disclosure could vary significantly depending on the trackability solution that will be used by the applicant. We expect, however, that applicants will specify the tracking solution and provide some indication of prior successful demonstrated use of the technology or service, either as part of a commercial or government venture. This would include addressing reliability of deployment of any deployable spacecraft parts that are being relied on for tracking. Tracking solutions that have not been well-established or previously demonstrated will be subject to additional scrutiny, and applicants may need to consider a back-up solution in those instances.

60. In addition, our rule provides flexibility for trackability demonstrations above LEO, where Aerospace states that it is not clear that a 10 cm x 10 cm x 10 cm object could be reliably tracked.¹⁹⁴ Aerospace states that the assumed size for reliable tracking in the GEO region by the current Space Surveillance Network is one meter, done primarily with optical sensors.¹⁹⁵ The Commission will address the trackability demonstration on a case-by-case basis for satellites that would operate above the LEO region, including in the GEO region, and we do not see the need at this time to include a specific size value in our rules for those space stations.

61. In the *Notice*, the Commission inquired whether there were hardware or information sharing requirements that might improve tracking capabilities, and whether such technologies are sufficiently developed that a requirement for their use would be efficient and effective.¹⁹⁶ Aerospace suggests that hardware such as transponders or other signature enhancements and data sharing would benefit trackability, but it is not clear that any commercial transponder hardware or comprehensive data sharing methods currently exist.¹⁹⁷ Aerospace states that a potential rule could drive development in this area, and consider enhancements such as radar reflectors for small objects in orbits well above LEO.¹⁹⁸ NASA cautions against relying on active tracking assistance that would no longer occur once the spacecraft is unpowered, and observes that at the present time, on-board tracking improvement methods such as beacons or corner cube reflectors are not sufficiently supported by space situational awareness assets to enable significant and reliable tracking improvements.¹⁹⁹ Keplerian Tech suggests that the

¹⁹¹ CSSMA Comments at 11; Aerospace Comments at 11 (stating that requiring trackability is more important than defining size of objects, but stating that the 10 cm tracking size can be used as an exemplar for the LEO region).

¹⁹⁹ NASA Comments at 5. NASA notes that this could change however, as the commercial space situational awareness industrial base broadens. *Id.*

Commission should mandate the use of an independent transponder solution, such as the space beacon that it has developed.²⁰⁰ Swarm suggests that trackability can be improved through the use of active or passive signature enhancements, such as the passive radar retro reflectors that would be used by Swarm's proposed satellites.²⁰¹ CSSMA opposes a specification of any particular type of tracking technology, and suggests that mandating use of an independent tracking solution would impose unnecessary costs on operators.²⁰² According to CSSMA, the level of trackability needed to maintain a safe orbital environment can already be attained by well-established active or passive tracking methods.²⁰³

62. We conclude that the provision of position data in addition to standard space situational awareness data, through radiofrequency identification tags or other means, may ultimately be a way to support a finding that a spacecraft smaller than 10 cm x 10 cm x 10 cm is trackable, but until the establishment of the commercial data repository, reliance on most alternative technologies does not appear to be readily implementable. A number of commenters oppose the adoption of any rule that would specify a particular type of tracking technology.²⁰⁴ We agree. While we encourage operators to use various means to ensure that their spacecraft is trackable and to help ensure that accurate positioning information can be obtained, we believe it is premature to require that operators use a particular tracking solution, such as an independent transponder.²⁰⁵ As technologies for obtaining spacecraft positioning information continue to evolve, however, we may revisit this issue in the future.

63. We do adopt the disclosure proposed in the *Notice* that applicants specify whether space station tracking will be active (that is, with participation of the operator by emitting signals via transponder or sharing data with other operators) or passive (that is, solely by ground based radar or optical tracking of the object).²⁰⁶ This disclosure, in connection with the other descriptive disclosures discussed in this section, will provide a way for the Commission and any interested parties to understand the extent to which the operator is able to obtain satellite positioning information separately from information provided by the 18th Space Control Squadron or other space situational awareness facilities. We believe this requirement presents minimal costs, since an operator will readily have access to this information based on the basic characteristics of its spacecraft (for example, will it be transmitting its Global Positioning System location information via transponder?).²⁰⁷ Operators are likely to select either active or passive means of tracking depending on the mission specifications, but it is useful for the Commission to understand as part of its holistic review of the application, the overall trackability and ability to identify the satellite.²⁰⁸

²⁰⁰ Keplerian Tech Comments at 14.

²⁰¹ Swarm Reply at 7-8. Swarm states that the passive radar retro reflectors increase the radar signature of a 1/4U satellite to more than the signature of the average 1U satellites in operation. *Id.*

²⁰² CSSMA Reply at 8.

²⁰³ *Id.*

²⁰⁴ Boeing Comments at 21-22; CSSMA Reply at 8.

²⁰⁵ *See, e.g.,* Keplerian Technologies Comments at 11-13 (suggesting that the Commission mandate use of an independent tracking solution on all licensed spacecraft). *See also* Intelsat Comments at 5 (suggesting that new NGSO satellites be equipped with broadcast beacons and/or corner reflectors).

²⁰⁶ *Notice*, 33 FCC Red at 11366, para. 36; *see* Appendix A, Final Rules.

²⁰⁷ *See* OneWeb Comments at 12 (supporting disclosure of whether satellite tracking will be active or passive); Intelsat Comments at 6 (proposing that NGSO operators certify that they will use available measures to track their satellites).

²⁰⁸ *See* Boeing Comments at 21 (stating that if the Commission adopts this information disclosure requirement, it should concurrently confirm that it does not require the use of active tracking systems and as long as an applicant's satellites can be tracked using passive measures, a statement is sufficient).

64. Relatedly, we also adopt the *Notice* proposal that operators certify that their space station will have a unique telemetry marker allowing it to be distinguished from other satellites or space objects.²⁰⁹ This is the same as the certification we have previously adopted for small satellites applying under the streamlined process,²¹⁰ and is unlikely to pose any additional costs for most operators, since the vast majority of operators already distinguish their satellite's signal from other signals through use of unique signal characteristics.²¹¹ Few commenters addressed this issue, and some expressed support²¹² or sought clarification.²¹³ As we clarified in the *Small Satellite Order*, we expect that when a spacecraft transmits telemetry data to the ground it will include in that transmission some marker that allows the spacecraft to be differentiated from other spacecraft.²¹⁴ This signal-based identification marker, which should be different from those of other objects on a particular launch, can assist with identification of a satellite for space situational awareness purposes.²¹⁵ Boeing argues that the Commission does not need to verify whether an active telemetry marker will be unique since satellite operators have adequate incentives to distinguish their own telemetry beacons from those of other satellites,²¹⁶ but we disagree, because smaller-scale operators may not have these incentives or know that they should implement this type telemetry marker to help identify their satellite.

65. *Identification.* Additionally, the Commission sought comment on whether applicants should be required by rule to provide information about the initial deployment to the 18th Space Control Squadron or any successor civilian entity.²¹⁷ We noted that, as an example, communications with the 18th Space Control Squadron may be particularly important in the case of a multi-satellite deployment to assist in the identification of a particular satellite.²¹⁸ We adopt a rule requiring that applicants disclose how the operator plans to identify the space station(s) following deployment, for example, how the operator plans to obtain initial telemetry.²¹⁹ We expect that for most operators this disclosure will be fairly straightforward, but requesting this information, alongside the other information requested on satellite trackability, will help the Commission and any other interested parties to understand whether the satellite poses a risk of being misidentified following deployment, for example, in the case of a multi-satellite deployment.²²⁰ As Global NewSpace Operators suggests, we will consider favorably in an application the

²⁰⁹ *Notice*, 33 FCC Rcd at 11366, para. 36; *see* Appendix A, Final Rules.

²¹⁰ *Small Satellite Order*, 34 FCC Rcd at 13098 para.56.

²¹¹ CSSMA notes, for example, that operators already voluntarily share their NORAD Catalog Number or International Designator, which are standard in the industry, with the 18th Space Control Squadron. CSSMA Comments at 11.

²¹² *See, e.g.*, Intelsat Comments at 5.

²¹³ University Small-Satellite Researchers sought clarification in the small satellite proceeding and here about what the Commission meant by a "unique telemetry marker." University Small-Satellite Researchers Comments at 11.

²¹⁴ *Small Satellite Order*, 34 FCC Rcd at 13098, para. 56.

²¹⁵ *Id.*

²¹⁶ Boeing Comments at 21-22.

²¹⁷ *Notice*, 33 FCC Rcd at 11366, para. 37.

²¹⁸ *Id.*

²¹⁹ *See* Appendix A, Final Rules. We also adopt a conforming rule in section 25.122 that is applicable to small satellites and small spacecraft applying under the streamlined processes. *See id.*

²²⁰ This approach is also generally supported by Global NewSpace Operators, who suggest that the Commission ask for disclosure from applicants that includes, among other things, the applicant's ability to obtain identification for its satellites. Global NewSpace Operators at 9 (also suggesting that applicants state the ability to obtain or generate precise orbit determination and identification for its satellite(s)). Once an operator has identified its space station(s), we also encourage the operator to share that information with the 18th Space Control Squadron. *See* Space-

(continued....)

use of radiofrequency transponder tags or other unique telemetry markers that can support the identification of objects once in orbit.²²¹ Overall, we want to emphasize the importance of operators planning for satellite identification in advance so that they are able to troubleshoot potential issues, particularly for multi-satellite deployments.²²² Also, as the Secure World Foundation suggests, we encourage additional research in this area on how identification aids may help distinguish one satellite from another early after payload separation.²²³

66. We also adopt a requirement that applicants must disclose whether the satellite will be registered with the 18th Space Control Squadron or successor civilian entity.²²⁴ At this time, the typical registration process for new operators includes contacting the 18th Space Control Squadron via e-mail with information on the satellite common name, launch date and time window, launch location and launching agency, the satellite owning organization and operating organization, the contact information for the operations center, and any usernames for the website Space-Track.org.²²⁵ A number of established operators also maintain ongoing relationships with the 18th Space Control Squadron, either directly or through intermediary organizations, such as the Space Data Association, and routinely exchange information about upcoming launch activities. It is possible that this process may change in the future, but we adopt a disclosure requirement broad enough to accommodate “registration” generally, even if the process changes. We conclude that the costs associated with the disclosure, to the extent they are not already routinely followed by most established operations, are outweighed by the importance of operators sharing information with a central entity that can provide space situational awareness support. Additionally, the operators themselves benefit from the services that are provided at no charge by the 18th Space Control Squadron, and so the burden of operators disclosing whether they are in fact benefiting from these services is minimal.

2. Ongoing Space Situational Awareness

67. *Sharing Ephemeris and Other Information.* In addition to the sharing of information related to initial identification of a satellite included in the *Notice*, the Commission also proposed that space station operators share ephemeris and information on any planned maneuvers with the 18th Space Control Squadron or any successor civilian entity.²²⁶ The *Notice* sought comment on whether this should be a requirement implemented through a rule.²²⁷ The *Notice* also sought comment on whether NGSO operators should be required to maintain ephemeris data for each satellite they operate and share that data

²²⁷ *Id.* at 11366, 11377, paras. 37, 73.

with any other operator identified in its disclosure of any operational space stations that may raise a collision risk.²²⁸ The Commission observed that this requirement would help to facilitate communications between operators even before a potential conjunction warning is given.²²⁹

68. Most commenters agreed with the goals of the proposed requirements.²³⁰ Some commenters argue that data sharing exchanges should respect owner/operator intellectual property and proprietary information and should be limited to only the information necessary to describe explicit maneuvers, initial deployment, or conjunction avoidance.²³¹ Several commenters also seek flexibility to share maneuverability and status data using any reasonable method identified by the providing operator.²³² After consideration of the record on this issue, we adopt a disclosure requirement regarding sharing of ephemeris and other data. Specifically, we adopt a rule stating that applicants must disclose the extent to which the space station operator plans to share information regarding initial deployment, ephemeris, and/or planned maneuvers²³³ with the 18th Space Control Squadron or successor entity,²³⁴ or other entities that engage in space situational awareness or space traffic management functions, and/or other operators.²³⁵ This also includes disclosure of risk thresholds for when an operator will deem it appropriate to conduct a collision avoidance maneuver. This disclosure provides an opportunity for the Commission to assess the extent to which the operator is actively engaging with space situational awareness facilities, keeping in mind that the need for such engagement may vary depending on the scale of the system.²³⁶ We observe that for certain types of systems, for example, those using electric propulsion, sharing of

²²⁸ *Id.* at 11377, para. 73.

²²⁹ *Id.*

²³⁰ *See, e.g.*, OneWeb Comments at 12; Telesat Comments at 6; Iridium Comments at 7-8; LeoSat Comments at 4; Intelsat Comments 5-6; Sirius XM Comments at 7-8; Iridium Comments at 7-8; Satellite Design-For-Recovery Comments at 2, 3; ORBCOMM Comments at 8.

²³¹ *See, e.g.*, CSSMA Reply at 9.

²³² *See* Boeing Comments at 22; Secure World Foundation Comments at 4; ORBCOMM Comments at 13; Lockheed Martin Comments at 11-12; CSSMA Reply at 8-9. CSSMA recommends, for example, that operators be encouraged, but not mandated to maintain a publicly available, regularly-updated repository of ephemeris and maneuverability data. CSSMA Comments at 11-12. As CSSMA notes in its comments, some operators, such as Planet and Spire, make ephemeris information public on an ongoing basis. *See* CSSMA Comments at 12 (citing, e.g., Planet Labs Public Orbital Ephemerides, Planet, <http://ephemerides.planet-labs.com/>).

²³³ In addition to this information, SpaceX also suggests that operators share information regarding any non-functional satellites or anomalies. SpaceX Comments at 14; *but see* Boeing Reply at 27 (suggesting that some of the information mentioned by SpaceX may not be relevant to the core tracking mission of the 18th Space Control Squadron). We encourage operators to share this information as well, including with the 18th Space Control Squadron or successor entity, if it is useful to that organization, or in the context of an operator-to-operator coordination.

²³⁴ Intelsat suggests that to facilitate data sharing, the Commission should encourage operators to agree on standards and established formats for sharing data, such as those used by the Consultative Committee for Space Data Systems. Intelsat Comments at 6. Aerospace commented that the recipient of the data will need to define the format and mechanism of the data sharing as well as accuracy verification. Aerospace Comments at 12. As part of the disclosure we encourage operators to disclose the format in which they will be sharing data—including whether it will be in a format acceptable to the 18th Space Control Squadron, for example. We note that the 18th Space Control Squadron has established guidance for submission of both ephemeris data and planned maneuvers. *See* 18th Space Control Squadron, Spaceflight Safety Handbook for Satellite Operators, Version 1.4, at 14, 27 (February 2019), available at https://www.space-track.org/documents/Spaceflight_Safety_Handbook_for_Operators.pdf. The 18th Space Control Squadron can also support spacecraft end-of-life operations.

²³⁵ *See* Appendix A, Final Rules.

²³⁶ We also adopt a conforming edit in section 25.122 to the rules applicable to small satellite and small spacecraft applicants for streamlined processing. *See* Appendix A, Final Rules.

ephemeris data is particularly critical in preventing collisions, and so we would look for a detailed description of those plans when assessing the application for those systems. The disclosure will also assist other operators in understanding how they may be able to best coordinate with the applicants' system and provide flexibility for operators to demonstrate how their plans for sharing information will facilitate space safety.²³⁷ As one example, a particular operator may decide to share ephemeris information with the private Space Data Association,²³⁸ which would be indicated in its disclosure.²³⁹ This also addresses any operator's concerns regarding proprietary information and security,²⁴⁰ since operators concerned with these issues could take them into consideration as part of their plan for how to share ephemeris²⁴¹

69. We also extend this disclosure to experimental and amateur systems at the authorization stage.²⁴² As with the rule updates discussed above, we believe the benefits of this disclosure in encouraging space safety and coordination outweigh any costs to the operator in specifying the extent to which, and how, it will share ephemeris and other information during operations.²⁴³

70. Tyvak suggests that requiring licensees to submit information pertaining to planned maneuvers is not conducive to the flexibility of agile space,²⁴⁴ but we do not see how submission of

²³⁷ Iridium, for example, states that it is critical that operators share their data with operators in nearby orbits, as it will help to ensure that operators make decisions related to satellite positioning based on the best situational awareness data available. Iridium Comments at 8. CSSMA notes that the reliability of owner-operator data cannot always be guaranteed, and thus should be used only to supplement any data gathered by a formal entity such as the 18th Space Control Squadron. CSSMA Reply at 9.

²³⁸ The Space Data Association is a private international organization that works with satellite operators in sharing of operational data for space situational awareness and space traffic management. See Space Data Association, <https://www.space-data.org/sda/> (last visited Jan. 16, 2020).

²³⁹ Association of Space Explorers state that it is unrealistic to assume that any voluntary exchange of information among satellite operators would be sufficient for them to coordinate operations to avoid conjunctions. Association of Space Explorers Comments at 8. We disagree. Based on our understanding of organizations such as the Space Data Association, some voluntary exchanges could support coordination to avoid conjunctions.

²⁴⁰ See, e.g., Keplerian Tech Comments at 14 (expressing concerns about proprietary rights associated with data generated by spacecraft and their associated transponders); Lockheed Martin Comments at 12 (expressing concern regarding any requirement for operators to provide data outside the U.S. Government, unless data security can be assured on a going forward basis); CSSMA Reply Comments at 9 (stating that sharing data exchanges should respect owner/operator intellectual property and proprietary information).

²⁴¹ We would expect, however, that if there are significant limitations on ways in which information that is being shared, or the quantity of information shared, the operator will demonstrate that it is not compromising space safety.

²⁴² See Appendix A, Final Rules. SES/O3b, ORBCOMM, Global NewSpace Operators ask us not to exempt experimental and amateur systems from obligations to maintain and share ephemeris data. SES/O3b Comments at 5; Global NewSpace Operators Comments at 18; ORBCOMM Comments at 6. See also University Small-Satellite Researchers Reply at 12 (agreeing that data sharing initiatives are useful tools for mitigating debris and collision risks). We recognize that some experimental or amateur missions may have more limited ability to provide tracking data, and those operators can specify any mission-related constraints on obtaining and sharing tracking data as part of this disclosure. See Global NewSpace Operators Comments at 18 (noting that some operators rely on the Department of Defense (18th Space Control Squadron)-produced ephemeris, and would not have their own ephemeris data to share).

²⁴³ Sirius XM suggests that we expand the scope of our proposal for sharing of ephemeris data to GSO satellites as well. Sirius XM Comments at 7. In the *Notice* the Commission proposed the rule specifically for NGSO systems, and we believe that sharing of GSO ephemeris and related issues are not necessarily a significant issue at least at this time—as our understanding is that there is general ongoing, cooperative participation of GSO operators in space situational awareness and space traffic management activities.

²⁴⁴ Tyvak Reply.

information in advance of planned maneuvers would have any significant impact on an operator's ability to perform such spacecraft maneuvers, and may provide other operators with useful information about the planned scope of operations that will facilitate coordination. Although we are adopting a disclosure requirement rather than an operational requirement, if this information changes during the course of the system's operations, the operator will need to update the file for its license or grant by specifying how it has changed.

71. We conclude that this disclosure is more beneficial than a more specific requirement, as it provides flexibility for operators to use a combination of different resources, including private sector space situational awareness resources, as well as accommodate potential changes in the U.S. entity responsible for space situational awareness and space traffic management functions relevant to non-Federal operators.²⁴⁵ In the near term, we encourage all operators to engage with the 18th Space Control Squadron, either directly or through intermediary organizations, and avail themselves of the space situational awareness and space traffic management functions that the 18th Space Control Squadron provides.²⁴⁶ At this time, we do not adopt a separate operational requirement regarding sharing of information with the 18th Space Control Squadron or other operators whose systems may pose a collision risk.²⁴⁷ We conclude that requirement is unnecessary given the application disclosure requirement we adopt here as well as the separate certification that upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary—and that the assessment and potential mitigation should include, as appropriate, sharing ephemeris data and other relevant operational information.²⁴⁸

72. *Conjunction Warnings.* The *Notice* proposed that applicants for NGSO space stations certify that, upon receipt of a conjunction warning, the operator of the satellite will take all possible steps to assess and, if necessary, to mitigate collision risk, including, but not limited to: contacting the operator of any active spacecraft involved in such warning; sharing ephemeris data and other appropriate operational information directly with any such operator; and modifying spacecraft attitude and/or operations.²⁴⁹ The Commission also sought comment on whether any different or additional requirements should be considered regarding the ability to track and identify satellites in NGSO or respond to conjunction warnings.²⁵⁰

73. As discussed below, based on the record, we adopt the proposal from the *Notice*. We believe this certification will enhance certainty among operators, and thereby help to reduce collision risk. Most commenters addressing this issue agreed generally with the Commission's proposal,²⁵¹ although some commenters had varying views on implementation of the proposed requirement. NASA and Aerospace recommend that applicants submit information outlining plans that they intend to follow operationally in order to minimize collision risk.²⁵² Global NewSpace Operators suggests that the

²⁴⁵ See, e.g., SPD-3, Section 6(d)(ii) (“[T]he Secretary of Commerce will make the releasable portions of the [catalog of space objects], as well as basic collision avoidance support services, available to the public, either directly or through a partnership with industry or academia.”). See also Global NewSpace Operators Comments at 9 (supporting establishment of a civilian agency whose authority will include space situational awareness and space traffic management specifically for civil and commercial space users).

²⁴⁶ Information and guidance related to the 18th Space Control Squadron is available at www.Space-Track.org.

²⁴⁷ See *Notice*, 33 FCC Rcd at 11377, paras. 72-73.

²⁴⁸ See Appendix A, Final Rules.

²⁴⁹ *Notice*, 33 FCC Rcd at 11366-67, para 38.

²⁵⁰ *Id.*

²⁵¹ See, e.g., LeoSat Comments at 4; University Small-Satellite Researchers Comments at 7; SpaceX Comments at 14; Intelsat Comments at 6; CSSMA Reply at 8-9.

²⁵² NASA Comments at 5.

Commission simply require the applicant to have an operational procedure and process for a conjunction warning, rather than a certification.²⁵³ We see the potential benefits of having applicants outline operational steps to minimize collision risk, but we believe that the information that would be included in this type of submission is already addressed by other aspects of the rules. As described above, we will request information on maneuverability of the satellites, and applicants will be required to disclose how they have coordinated or plan to coordinate with other operators whose satellites may pose a collision risk, as well as disclose how they plan to share ephemeris and other information during the course of the spacecraft operations.

74. Other commenters suggest modifications to the language of the proposed rule to provide operators with some additional flexibility when responding to conjunction warnings. The Commission's proposed rule stated that the space station operator "must certify that upon receipt of a space situational awareness conjunction warning, the operator will review the warning and take all possible steps to assess and, if necessary, to mitigate collision risk, including, but not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; modifying space station attitude and/or operations."²⁵⁴ Several commenters, including SIA, Telesat, and others, were concerned that the use of the term "all possible steps" would not give operators enough flexibility to decide how to respond, and proposed the language "appropriate steps" instead.²⁵⁵ Taking into consideration the concerns expressed in the record, we adopt a slightly different formulation of the certification. Specifically, the rule we adopt states that the space station operator must certify that upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations. We believe that the terms "if necessary" and "as appropriate" provide sufficient flexibility for operators to determine what is appropriate in individual cases. Finally, Boeing suggests that this requirement may be unnecessary, because operators already have sufficient incentives to avoid collision risks.²⁵⁶ We conclude, however, that this certification is useful in ensuring that all space actors, in particular new space actors, are aware of and have planned responses to conjunction warnings, consistent with responsible space operations.

75. We also encourage operators to reference industry-recognized best practices in addressing conjunction warnings. NASA, for example, notes that there are currently industry-recognized best practices of submitting ephemerides to the 18th Space Control Squadron for screening, examining and processing all resultant conjunction warnings from each conjunction screening, mitigating high-interest events at a level consistent with the mission's risk mitigation strategy, and explicit conjunction avoidance screening by the 18th Space Control Squadron of ephemerides that include any risk mitigation maneuvers prior to maneuver execution.²⁵⁷

²⁵³ Global NewSpace Operators at 10.

²⁵⁴ *See Notice*, 33 FCC Rcd 11397, Appendix A, Proposed Rules.

²⁵⁵ *See, e.g.* SIA Comments at 7-8; Telesat Comments at 6.

²⁵⁶ Boeing Comments at 22.

²⁵⁷ NASA Comments at 5. NASA further states that if a secondary object in a potentially serious conjunction is an active satellite, a contact protocol between both satellite owners/operators should be initiated, so that potential mitigation actions can be coordinated and any planned maneuvers fully shared.

D. Topics Related to Creation of Debris During Operations

76. The Commission’s existing orbital debris rules require disclosure of debris released during normal operations.²⁵⁸ This has been a longstanding requirement, and is consistent with the revised U.S. Government Standard Practices objective regarding “Control of Debris Released During Normal Operations.”²⁵⁹ The Commission observed in 2004 that communications space stations do not typically involve the release of planned debris.²⁶⁰ Although there are some unique experiments on space stations today that do potentially involve the planned release of debris, we observe that most communications space stations still do not typically release debris absent some type of anomaly. Where there is a planned release of debris, however, we examine such plans on a case-by-case basis.²⁶¹ Accordingly, the Commission did not propose to update our general rule in this area, as it has functioned well for the past 15 years. In the *Notice*, the Commission did propose to update its rules, however, in two specific areas related to the release of debris, discussed below, which reflect evolving satellite and launch technologies.²⁶²

1. Deployment Devices

77. In the *Notice*, the Commission observed that in several instances applicants sought to deploy satellites using deployment mechanisms that detach from or are ejected from a launch vehicle upper stage and are designed solely as a means of deploying a satellite or satellites, and not intended for other operations—and that once these mechanisms have deployed the onboard satellite(s), they become orbital debris.²⁶³ In one example, the Commission received applications for communications with deployment devices designed to deploy smaller spacecraft after the devices separating from the launch vehicle.²⁶⁴ In another example, the Commission received an application for an experimental satellite that would be released from a tubular cylinder deployer, using a spring mechanism.²⁶⁵ There are also more well-established uses of deployment devices, such as a separation ring used to facilitate the launch of geostationary satellites. Several commenters explain the advantages of use of deployment devices such as rings or other deployment vehicles, sometimes referred to as “free-flyers,” stating, for example, that such devices can allow safe, reliable deployment of multiple spacecraft.²⁶⁶ Spaceflight posits that deployment

²⁵⁸ See *2004 Orbital Debris Order*, 19 FCC Rcd at 11578, para. 24.

²⁵⁹ ODMSP, Objective 1. While the revised ODMSP does provide some additional guidance on matters related to the planned release of debris, these detailed issues can be addressed as part of our case-by-case analysis in any instances where there is a planned release of debris. Accordingly, we do not update our rules to explicitly address these issues. See *Boeing Feb. 14, 2020 Ex Parte* at 12-13

²⁶⁰ *2004 Orbital Debris Order*, 19 FCC Rcd at 11578, para. 24.

²⁶¹ *Id.* at para. 24. See NASA Comments at 2 (noting that the entity seeking a license should be required to disclose any spacecraft deployed from the entity’s spacecraft that does not require an application for a license from the Commission for radio communications).

²⁶² *Notice*, 33 FCC Rcd at 11359-61, paras. 18-23.

²⁶³ *Id.*

²⁶⁴ See, e.g., *Spaceflight Inc.*, IBFS File No. SAT-STA-20150821-00060 (SHERPA)(mission was ultimately cancelled); *Spaceflight, Inc.*, IBFS File No. SAT-STA-20180523-00042 (SSO-A) (granted Oct. 12, 2018).

²⁶⁵ See *Open Space Networks*, ELS File No. 0957-EX-ST-2016, Exh. ODAR at 1-2.

²⁶⁶ Spaceflight Comments at 4; see *Boeing Comments* at 8 (use of separating devices can help prevent satellites from damaging each other, thus avoiding satellite components from separating from the satellite, or the catastrophic loss of an entire spacecraft); *CSSMA Comments* at 4 (deployment devices enable small-to-medium sized spacecraft to be aggregated onto a single mission, making launch efficient and affordable).

devices contribute to a safe space environment, where such devices allow spacecraft to be placed into orbit using well-established launch services and well-designed and planned deployment missions.²⁶⁷

78. The Commission proposed in the *Notice* to require disclosure by applicants if “free-flying” deployment devices are used to deploy their spacecraft, as well as requiring a specific justification for their use.²⁶⁸ We adopt our proposal, and require that applicants for a Commission license disclose whether they plan to have their spacecraft deployed using a deployment device.²⁶⁹ This includes disclosure of all devices, defined as separate deployment devices, distinct from the space station launch vehicle,²⁷⁰ regardless of whether they will be authorized by the Commission.²⁷¹ Although in some instances it is difficult to draw a clear line between a launch vehicle and deployment device, for purposes of this rule, as explained below, we consider a deployment device to be a device not permanently physically attached to or otherwise controlled as part of the launch vehicle. For purposes of this discussion, we distinguish between consideration of orbital debris mitigation issues involving such free-flying deployment devices and consideration of orbital debris mitigation issues involving multi-satellite deployments generally, including use of deployment devices that are part of or remain attached to the launch vehicle.

79. We have considered the arguments of Eutelsat, University Small-Satellite Researchers, and Boeing, who suggest that it would be burdensome for space station applicants to disclose information regarding free-flying or uncoupled deployment devices.²⁷² Eutelsat states that satellite operators are not responsible for launch procedure and do not choose the specific deployment device used for launch of their satellite, which may not be determined until after the space station application is submitted.²⁷³ Some

²⁶⁷ Spaceflight Comments at 3-4. Spaceflight asserts that the alternative to its SSO-A mission, for example, would have been 63 separate uncoordinated missions which could cause a real potential re-contact hazard without the kind of engineering analysis and support provided by Spaceflight. *Id.* at 4.

²⁶⁸ *Notice*, 33 FCC Rcd at 11359, paras. 19-20. As proposed, the rule would apply to both GSO and NGSO space station applicants.

²⁶⁹ *See* Appendix A, Final Rules.

²⁷⁰ *See id.*

²⁷¹ For Commission-authorized devices, as explained below, this can be disclosed by referencing the deployment device application file number. Devices not authorized by the Commission could include, for example, deployment devices not requiring an authorization for radiocommunications, or obtaining an authorization for radiocommunications from an administration other than the United States.

²⁷² Eutelsat Comments at 2-3 (commenting from the GSO perspective); University Small-Satellite Researchers Comments at 17-18 (stating that requiring additional information from university passengers would be unreasonably burdensome since university researchers’ primary means of deployment is to secure excess launch capacities where available); Boeing Reply at 12 (agreeing with Eutelsat’s comments). *See also* Tyvak Reply. Boeing further argues that because the ODMSP does not include any specific guidance on the regulation and use of uncoupled deployment devices, the Commission should not adopt any requirements in this area. Boeing Feb. 14, 2020 *Ex Parte* at 4-5. The ODMSP states that spacecraft should be designed to eliminate or minimize debris released during normal operations. ODMSP at 1-1. We conclude here that it is appropriate to address the use of deployment devices within the scope of this overall objective. Boeing further argues that on this topic the Commission should only adopt the ODMSP guideline stating that all planned released debris larger than 5 mm in any dimension, the total debris object-time product in low Earth orbit (LEO) should be less than 100 object-years per upper stage or per spacecraft. Boeing Feb. 14, 2020 *Ex Parte* at 13. This guidance elaborates on, but does not replace, the overall guidance that spacecraft be designed to eliminate or minimize debris released during normal operations. *See* ODMSP 1-1. Thus, the debris object-time guideline should not replace our broader requirement that operators have assessed and limited the amount of debris released in a planned manner during normal operations, including a disclosure, where applicable, regarding any separate deployment devices.

²⁷³ Eutelsat Comments at 2-3; *see* Telesat Comments at 2 (stating that the manner of satellite deployment may be unknown to satellite applicants at the time authority to operate the satellite is sought from the Commission).

commenters suggest that information regarding a free-flying deployment device should be outside the scope of the Commission's purview, either for jurisdictional or practical reasons.²⁷⁴ We disagree with these points. It is reasonable to consider objects with limited purpose, other than launch vehicles, as part of the deployment or operations of a Commission-licensed spacecraft. Free-flying deployment devices are, in terms of their effect on the orbital debris environment, indistinguishable from lens covers, tie-down cables, and other similar devices, in that they fulfill a limited function and then become debris. In some instances, the required disclosure may be as straightforward as incorporating by reference the information contained in a separate Commission application that has been submitted by the operator of the deployment device.²⁷⁵ In other instances, the space station operator will need to obtain the information regarding the deployment device from the operator and/or manufacturer of that device.²⁷⁶ The space station operator will be able to obtain this information, since the space station will be using the deployment device. Second, our experience has been that FAA launch-related analyses do not include consideration of free-flying or separated deployment devices, since such devices are not considered part of the launch vehicle.²⁷⁷ In this sense, depending on the factual scenario, the devices can be considered either "spacecraft" or "operational debris" related to the authorized space stations.²⁷⁸ Our goal is to avoid a regulatory gap in which the orbital debris issues associated with a particular deployment device are not under review by any government entity. We will continue to coordinate with the FAA as needed, and in any case where an applicant believes that the deployment device would be under the FAA's authority, the applicant should make us aware so we can coordinate with the FAA in the particular case and avoid overlapping review.²⁷⁹ Eutelsat points out that in some instances the launching entity may not even be within U.S. jurisdiction or regulatory authority.²⁸⁰ In these instances, the operator should still provide information regarding use of any free-flying or separated deployment devices, consistent with our policy to require same information related to orbital debris mitigation from market access applicants as from

²⁷⁴ See, e.g., Eutelsat Comments at 3; University Small-Satellite Researchers Comments at 18; Telesat Comments at 2. See also Global NewSpace Operators Comments at 6 (stating that the Commission should harmonize orbital debris mitigation efforts with other governmental efforts in this area). Several of the comments on this topic do not distinguish between unattached, free-flying deployment devices and deployment devices that are considered part of the launch vehicle. Here, we address these comments only to the extent that they relate to those devices that are not part of the launch vehicle.

²⁷⁵ For example, Spaceflight filed applications for free-flying deployment devices with the Commission, requesting authority to use radiofrequencies to communicate with the deployers. See *Spaceflight Inc.*, IBFS File No. SAT-STA-20150821-00060 (SHERPA) (the mission was ultimately cancelled); *Spaceflight, Inc.*, IBFS File No. SAT-STA-20180523-00042 (SSO-A) (granted Oct. 12, 2018).

²⁷⁶ We recognize that this information is not always available to applicants at the time when the application is filed, but applicants can supplement their application materials with this information once available, and update the Commission regarding any changes. See University Small-Satellite Researchers Comments at 18; Boeing Reply at 12.

²⁷⁷ See, e.g. *Spaceflight Inc.*, IBFS File No. SAT-STA-20150821-00060 (SHERPA), Oct. 26, 2016 Attachment to Grant, at condition 3 & n.6); *Spaceflight, Inc.*, IBFS File No. SAT-STA-20180523-00042 (SSO-A), Oct. 12, 2018 Attachment to Grant, at condition 2 & n.10.

²⁷⁸ In the *Notice*, we proposed that the rule cover any separate deployment devices "not part of the space station launch." 33 FCC Rcd at 11396, Appendix A, Proposed Rules. In an effort to clarify the scope of the rule, we adopt a slightly different formulation here, which states that the rule covers any separate deployment devices that are "distinct from the space station launch vehicle, that may become a source of orbital debris." See Appendix A, Final Rules.

²⁷⁹ See Global NewSpace Operators Comments at 6 (stating that if orbital debris mitigation measures overlap with informational requirements of other agencies, then the applicant should provide a reference to the authorization of the other agency).

²⁸⁰ Eutelsat Comments at 3.

U.S. license applicants.²⁸¹ For example, it would not be in the public interest for us to authorize market access for a non-U.S.-licensed satellite where the satellite meets our orbital debris mitigation requirements, but will be deployed by a free-flying device that has a 200-year on-orbit lifetime and presents a significant collision risk. Although, as Eutelsat states,²⁸² market access may be requested long after the satellite is launched, that fact has not prevented us from applying our orbital debris regulations to such satellites in the past.²⁸³

80. We will continue to largely assess these on a case-by-case basis at this time, since the individual facts can vary widely and so it is difficult to assess specific disclosure rules for each different type of device that may be used.²⁸⁴ Consistent with the *Notice* proposal, we will require that applicants disclosing the use of a deployment device also provide an orbital debris mitigation disclosure for any separate deployment devices. The information provided by applicants should address basic orbital debris principles, such as the orbital lifetime of the device, and collision risk associated with the device itself.²⁸⁵ Where applicable, the information should also address the method, sequencing, and timing by which the spacecraft be deployed into orbit. Boeing opposes the adoption of an information disclosure requirement absent “clear and objective criteria articulating when the use of such devices is permissible.”²⁸⁶ There are a variety of facts to assess in connection with use of deployment device and potential for contribution to the orbital debris environment. In some uses, a deployment device may become debris, but serve to decrease the collision risk associated with the individual deployed objects. In the case of well-established deployment practices, such as use of a detachable separator ring for a GSO deployment, the disclosure should be relatively straightforward, and we would not expect operators to provide significant detail regarding utilization of such a deployment practice. In other instances, use of a deployment device may increase the risk of collision among satellites deployed from the device, as compared to other means of deployment, even where the device itself may present a low risk. The different factual scenarios presented here illustrate the difficulty in making a “one-size-fits-all” rule when it comes to determining

²⁸¹ See, e.g., *2004 Orbital Debris Order*, 19 FCC Rcd at 11606, para. 94.

²⁸² Eutelsat Comments at 3.

²⁸³ See, e.g., SES Satellites (Gibraltar) Limited, IBFS File No. SAT-MPL-20160718-00063 (grant dated Dec. 14, 2016) (as part of modification application for market access applicant, the Commission granted request for waiver of a Commission rule requiring that space stations must discharge all stored energy sources remaining at spacecraft end-of-life); Satelites Mexicanos, S.A. de C.V., IBFS File No. SAT-PPL-20150227-00008 (grant dated June 12, 2015) (Commission similarly considered, as part of grant of market access application, request for waiver of Commission rule regarding discharge of stored energy sources at spacecraft end-of-life).

²⁸⁴ In *ex parte* filings, SIA expresses concern with the Commission’s review of deployment devices on a case-by-case basis without identifying any criteria for their permissible use, such as required number of years for disposal. See Letter from Tom Stroup, President, Satellite Industry Association, to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, Attach. at 4 (email to Tom Sullivan, Chief of the International Bureau, FCC) (filed April 15, 2020) (SIA Apr. 15, 2020 *Ex Parte*). We would have concerns regarding use of a deployment device if the device constitutes a debris object that exceeds 25 years on orbit in the LEO region, or exceeds the 0.001 collision risk probability that would be assessed if it were an otherwise functional spacecraft, for example, as indicia associated with negatively contributing to the debris environment. See also Letter from Bruce A. Olcott, Counsel to the Boeing Company, to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 3 (filed April 16, 2020) (Boeing Apr. 16, 2020 *Ex Parte*). Boeing argues that deployment devices should be addressed in the Further Notice, *see id.*, but we find that the disclosure-based approach adopted here is appropriate for the limited number of cases and variety of factual scenarios involved.

²⁸⁵ See Spaceflight Comments at 6 (stating that the risk posed by free-flying deployment devices as objects in space can be accounted for under a normal debris risk assessment analysis); Global NewSpace Operators Comments at 6 (stating that generally propulsive or powered release mechanisms should be treated as any other satellite and be subject to the same mitigation requirements).

²⁸⁶ Boeing Comments at 8; Boeing Reply at 11.

what is an acceptable use of a deployment device. We conclude that the more effective approach at this time is to adopt a disclosure requirement, and to continue to assess the specific uses on a case-by-case basis. Disclosure in this instance provides flexibility to address new developments in space station design and facilitates the Commission identifying facts to support decisions to grant, condition, or deny an authorization in a manner consistent with the Communications Act.²⁸⁷

81. We also received a number of comments related to the best means in which to evaluate collision risk specifically associated with the deployment of multiple satellites from a deployment device (e.g., re-contact analysis²⁸⁸).²⁸⁹ We expect that recontact analysis will be conducted by operators, and that information will be provided to the Commission, but we do not adopt specific rules in this Order on how to conduct a re-contact analysis in the instance where a deployment device is deploying multiple satellites. Free-flying deployers releasing multiple satellites are still relatively new, and there is not consensus on what constitutes an adequate analysis of re-contact risk,²⁹⁰ and the extent to which re-contact risk is different from typical collision risk in terms of likelihood of creating debris.²⁹¹ Accordingly, we will continue to assess this issue on a case-by-case basis in the context of a particular mission profile. In addition to compiling information regarding collision risk, however, we encourage operators of free-flying deployment devices to adopt practices that will help reduce risks associated with multi-satellite deployments—including formulating a deployment sequence that minimizes re-contact risks and making other operators with satellites nearby aware and updated on the scope of the deployment.²⁹²

82. Additionally, we do not adopt rules in this Order related to multi-satellite launches more generally, i.e. multi-satellite launches not involving separate, free-flying deployment devices. In the *Notice*, the Commission also sought comment on whether we should include in our rules any additional information requirements for satellite applicants that will be part of a multi-satellite launch. A number of commenters suggested that these issues should be handled by the launch licensing authority and/or that there would be other difficulties involved in requiring additional information regarding launch and deployment from an FCC applicant. We observe that there are a number of established practices for multi-satellite deployment that are associated with low risk of re-contact, or otherwise a low risk of debris creation since any recontact would occur at low velocities. While we decline to adopt any rules related to this topic at this time, we may revisit this issue in the future.

2. Minimizing Debris Generated by Release of Persistent Liquids

83. In the *Notice*, the Commission proposed to update the rules to cover the release of liquids that, while not presenting an explosion risk, could nonetheless, if released into space, cause damage to other satellites due to collisions.²⁹³ Specifically, the Commission proposed to include a requirement to identify any liquids that if released, either intentionally or unintentionally, will persist in droplet form.²⁹⁴ The Commission observed that there has been increasing interest in use by satellites (including small satellites) of alternative propellants and coolants, some of which would become persistent liquids when

²⁸⁷ Boeing Comments at 8; Boeing Reply at 11.

²⁸⁸ In this context, re-contact is the potential for two or more satellites or released as part of a multi-satellite deployment to subsequently collide with each other or with any free-flying deployment devices that may be used for the deployment.

²⁸⁹ See, e.g., Spaceflight Comments at 4-5; ORBCOMM Comments at 15-16; CSSMA Comments at 4-5; Aerospace Comments at 12; D-Orbit Comments at 2.

²⁹⁰ Spaceflight Comments at 4-5.

²⁹¹ See *id.*

²⁹² See, e.g., NASA Comments at 6; Aerospace Comments at 12.

²⁹³ *Notice*, 33 FCC Rcd at 11360-61, paras. 22-23.

²⁹⁴ *Id.* at 11360-61, para. 23.

released by a deployed satellite.²⁹⁵ The *Notice* also stated our expectation that the orbital debris mitigation plan for any system using persistent liquids should address the measures taken, including design and testing, to eliminate the risk of release of liquids and to minimize risk from any unplanned release of liquids.²⁹⁶

84. Some commenters addressing this issue disagreed with the Commission adopting a rule to address this issue, with most expressing concern that there was not sufficient evidence that release of certain propellants, for example, would result in persistent droplets or create any additional risk in the orbital environment.²⁹⁷ Along these lines, Aerospace states that it is important to distinguish between releases that could result in droplets or solids that could be a collision threat and those that dissipate or are too small to cause damage on impact.²⁹⁸ Aerospace points out, for example, that there are a number of beneficial operations including venting or using excess propellant and oxidizer that constitute release of liquids that are less likely to cause impact damage.²⁹⁹ Aerospace recommends that the Commission's proposed rule be clarified to explicitly permit the venting of volatile liquids and pressurants that could create future risk of fragmenting the spacecraft if not released, but will not form hazardous droplets.³⁰⁰ We agree that it is important to distinguish between those releases that could result in a long-term risk to the orbital environment and those that are unlikely to create any significant additional risks, such as release of volatile propellants that are soon dispersed through natural processes. Additionally, we have long recognized the importance of operators limiting the risk of accidental explosions, including by venting pressurized systems at a spacecraft's end of life.³⁰¹

85. We adopt our proposed disclosure requirement, but clarified to require that applicants must specify only the release of those liquids that may in fact persist in the environment and pose a risk.³⁰² Thus, the applicant will determine whether any liquids have a chemical composition that is conducive to the formation of persistent droplets. If so, then the applicant will disclose that fact to the Commission.³⁰³

²⁹⁵ *Id.* at 11360, para. 22.

²⁹⁶ *Id.* at 11361, para. 23.

²⁹⁷ *See, e.g.*, CSSMA Comments at 3; Lockheed Martin Comments at 8.

²⁹⁸ Aerospace Comments at 7.

²⁹⁹ *Id.*

³⁰⁰ *Id.*

³⁰¹ *See also* 47 CFR §25.114(d)(14)(ii); *2004 Orbital Debris Order*, 19 FCC Rcd at 11580-82, paras. 29-33. Boeing asks that we update our rules regarding removal of stored energy at the spacecraft's end-of-life to acknowledge that stored energy sources can be "safed." Boeing Feb. 14, 2020 *Ex Parte* at 7-8. It is unclear exactly what Boeing requests, but to the extent that Boeing is concerned that the existing rule does not adequately address removal of stored energy, we note that our existing rules leaves various options for stored energy to be discharged or removed, including by indicating that "other equivalent procedures" or "other appropriate measures" may be used in addition to the enumerated examples provided in sections 25.114(d)(14)(ii) and 25.283(c) of the Commission's rules, respectively. 47 CFR § 25.114(d)(14)(ii), 25.283(c). We view our provisions on this topic as consistent with the ODMSP. Should an applicant seek to use measures not specifically listed in sections 25.114(d)(14)(ii) and 25.283(c), we would expect that the applicants would provide documentation regarding the chosen method, consistent with the types of documentation that listed in the NASA Standard regarding eliminating stored energy sources. *See* NASA Standard 4.4.4.2.

³⁰² According to Boeing, the Commission must ensure that an adequate mechanism is in place to permit the submission of information regarding such liquids on a confidential basis, since satellite manufacturers treat their propellants as highly proprietary. Boeing Comments at 9. Similar to other contexts, we point out that there are means for applicants to submit information confidentially, in instances where they are able to justify confidential treatment under the Commission's rules. *See* 47 C.F.R. § 0.459.

³⁰³ Boeing states that the Commission should provide clear and objective guidance regarding when the use of such liquids would be permitted. Boeing Comments at 9; Boeing Feb. 14, 2020 *Ex Parte* at 13. SIA similarly expresses (continued....)

The main consideration in making this determination is whether the liquid, if released into space, will disperse through evaporation, or remain in droplet form, as is typical of some ionic liquids, such as NaK droplets. If the applicant determines that released liquids will not persist due to evaporation or chemical breakdown, for example, then the applicant need not address the release of such liquids.³⁰⁴ We conclude that asking applicants—who have the most information regarding the operational profile of the mission and characteristics of the potentially released substances—to assess the risk will address the commenters' concerns that such a requirement may be overinclusive or premature.³⁰⁵ We clarify that this rule would apply to any liquids, not just propellants.³⁰⁶ In addition, we clarify that this rule will apply equally to release of liquids throughout the orbital lifetime.³⁰⁷ We further conclude that the benefit of identifying potential risks associated with use of certain liquids, if such liquids could become long-term debris objects, outweighs any costs to operators in assessing the chemical composition of any liquids to determine the physical properties of such liquids following release into the orbital environment.

E. Post-Mission Disposal

86. Post-mission disposal is an integral part of the mitigation of orbital debris, and the commercial space industry has increasingly recognized the importance of not leaving defunct objects in orbit after their useful life. In 2004, the Commission established specific rules for GSO space station disposal based on U.S. and international guidance,³⁰⁸ and in the absence of an anomaly, Commission-authorized space station operators have complied with those rules. In this Order, we adopt specific rules for disposal of NGSO space stations, and address reliability of post-mission disposal for NGSO space stations as well. As in 2004, we base these rules on updated sources of guidance, including the revised ODMSP, adapted for the commercial and otherwise non-governmental context.

87. The orbital lifetime of a particular space station affects the collision risk it presents and

(Continued from previous page) _____
concern with a case-by-case approach for reviewing these matters. SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 4-5. Here, we believe a disclosure requirement should entail minimal costs for most operators and will provide flexibility to address new developments in space station design. As Boeing points out, there may be tradeoffs associated with use of certain new types of propellants in terms of orbital debris mitigation, and we believe these tradeoffs are best addressed on a case-by-case basis. See Boeing Comments at 10. Relevant considerations in cases involving use of persistent liquids may include, for example, design and testing of methods for containment of the liquid and prevention of release in space in droplet form. In a later *ex parte* filing, Boeing asks that we consider these issues in the Further Notice. See Boeing Apr. 16, 2020 *Ex Parte* at 3. For the reasons specified here, however, we believe that a case-by-case approach is sufficient at this time to address this relatively unique issue.

³⁰⁴ Boeing asks that we state that the use of liquids that would result in persistent droplets if released is presumptively appropriate if reasonable measures are taken to prevent their release. Boeing Comments at 10. If the operator discloses that such liquids would present a risk to the orbital environment if accidentally released, then we would ask operators to describe the measures that are taken to prevent such accidental release. If unintentional release of the liquids would present a significantly greater risk to the orbital environment that would be otherwise posed by an accidental explosion of the spacecraft (not taking into account release of the liquids), for example, then the operator should expect to provide additional information to the Commission regarding measures taken to prevent release as well as potential alternatives.

³⁰⁵ See, e.g., CSSMA Comments at 5 (opposing regulation of non-traditional propellants and propellant systems that identifies the type of liquid and does not also take into account the design and engineering specific of the particular propulsion system); Tyvak Reply (stating that the Commission should become more familiarized with such risks before adding to the requirements); CSSMA Reply at 3 (same).

³⁰⁶ See Lockheed Martin Comments at 8 (stating that it is unclear whether the discussion extends to liquids other than propellants and asking for specific exemptions).

³⁰⁷ See Telesat Comments at 2 (stating that the Commission's approach regarding release of debris during normal operations should apply to the release of persistent liquids during or at the end of a mission).

³⁰⁸ 2004 *Orbital Debris Order*, 19 FCC Rcd at 11593-98, paras. 64-76.

reduction in post-mission orbital lifetime reduces collision risk. Spacecraft that are unable to complete post-mission disposal, particularly when left at higher altitudes where they may persist indefinitely, will contribute to increased congestion in the space environment over the long-term and increase risks to future space operations.

1. Post-Mission Orbital Lifetime

88. In the *Notice*, the Commission inquired whether the 25-year benchmark for completion of NGSO post-mission disposal by atmospheric re-entry remains a relevant benchmark, as applied to commercial or other non-Federal systems.³⁰⁹ The 25-year benchmark has been applied in Commission licensing decisions for NGSO systems. The NASA Standard and ODMSP specify a maximum 25-year post-mission orbital lifetime, with the revised ODMSP stating that for spacecraft disposed of by atmospheric reentry, the spacecraft shall be “left in an orbit in which, using conservative projections for solar activity, atmospheric drag will limit the lifetime to as short as practicable but no more than 25 years.”³¹⁰ Most commenters supported a reduction in the 25-year benchmark as applicable to non-Federal systems, but disagreed on the length of time, and on whether a single benchmark was appropriate for all missions.³¹¹

89. As a practical matter, space stations that conduct collision avoidance maneuvers would achieve the main goal of limitations on orbital lifetime—avoiding collisions with large objects. Even with no maneuver capability, spacecraft deployed to and operating below 400 km generally re-enter Earth’s atmosphere as a result of atmospheric drag within, at most, several years. For such satellites, when functioning normally, specification of a maximum post-mission orbital lifetime may be unnecessary. We examine in the Further Notice a maneuverability requirement for satellites operating above 400 km. Given the practical reality that satellites with maneuvering capabilities are likely to meet the objectives of limitations on post-mission orbital lifetime, the need to incorporate a separate provision into our rules regarding post-mission orbital lifetime will depend on whether we adopt a maneuverability requirement, and therefore will be addressed in the Further Notice.

90. At this time, we will require that applicants planning disposal by atmospheric re-entry specify the planned time period for post-mission disposal as part of the description of disposal plans for the space station.³¹² We maintain the Commission’s existing rule requiring a statement detailing post-mission disposal plans for the space station at end of life. The *Notice* also sought comment on whether we should account for solar activity in our rules or grant conditions.³¹³ We note that the NASA Debris Assessment Software takes into consideration solar flux that may affect atmospheric drag, among other environmental factors.³¹⁴ To the extent that the operator plans to rely on atmospheric drag for re-entry,

³⁰⁹ *Notice*, 33 FCC Rcd at 11372-73, paras. 58-59.

³¹⁰ ODMSP 4-1.b.

³¹¹ See, e.g., SpaceX Comments at 6; Iridium Comments at 8-9; Global NewSpace Operators Comments at 16; Intelsat Comments at 7; Maxar Comments at 13; OneWeb Reply at 5.

³¹² See Appendix A, Final Rules.

³¹³ *Orbital Debris Notice*, 33 FCC Rcd at 11373, para. 59.

³¹⁴ Deviations in solar activity, which generally track the 11-year solar cycle, can affect the force that atmospheric drag exerts on satellites in low-Earth orbit. NASA periodically updates the solar flux value (which measures solar activity) for inclusion in the Debris Assessment Software, retrieved from a model based on NOAA short-term predictions and NASA long-term predictions. See NASA Orbital Debris Program Office, Debris Assessment Software, <https://orbitaldebris.jsc.nasa.gov/mitigation/debris-assessment-software.html> (last visited Jan. 13, 2020) (describing installation instructions for inputting updated solar flux files); DAS User’s Guide Version 3.0, at C.4 (July 2019), <https://ntrs.nasa.gov/archive/nasa/casi.ntrs.nasa.gov/20190027721.pdf>; see also D. Whitlock, “Modeling the Effect of High Solar Activity on the Orbital Debris Environment,” *NASA Orbital Debris Quarterly News*, vol. 10, no. 2, p.4 (April 2006), <https://orbitaldebris.jsc.nasa.gov/quarterly-news/pdfs/odqnv10i2.pdf>.

reliance on NASA Debris Assessment Software or a higher fidelity assessment tool will meet the requirement on specifying the time period for post-mission disposal.³¹⁵

91. The Commission also sought comment on whether operators planning disposal through atmospheric re-entry should be required to continue obtaining spacecraft tracking information, for example by using radio facilities on the spacecraft to the greatest extent possible following the conclusion of the primary mission.³¹⁶ Boeing argues that satellite operators should not be required to maintain communication links and active tracking with the satellite following the end of the missions unless they had initially indicated in the application that active tracking, rather than passive tracking, would be used to monitor the location of the spacecraft.³¹⁷ Boeing also states that satellite operators should be required to continue to obtain spacecraft tracking information for retired satellites only if the satellite operator's original calculations regarding acceptable collision risk as the satellite's orbit decays depend upon the operator's ability to conduct collision avoidance.³¹⁸ Iridium, on the other hand, suggests that satellites should be controlled all the way through atmospheric re-entry.³¹⁹ We do not adopt a specific regulation specifying the extent to which an operator should be required to maintain communications links or otherwise obtain spacecraft tracking information following the conclusion of the satellite's main mission at this time,³²⁰ since absent any particular requirements to maintain maneuvering capabilities, for example, operators are likely to have a wide range of capabilities in this area such that it would not be reasonable to adopt a "one-size-fits all" rule absent other requirements such as requiring active tracking capabilities, which we decline to adopt above. We do, however, encourage all operators to maintain communications links for tracking, control, and collision avoidance purposes for as long as possible following the conclusion of the spacecraft's primary operations, even below 400 km, and to continue to provide location information to the 18th Space Control Squadron and other operators for as long as possible, in accordance with the operators' plan for sharing ephemeris.

³¹⁵ See Notice, 33 FCC Rcd 11373, para. 59. NASA observes that accounting for the effect of small variations in solar activity on orbital lifetime is not necessary given that the effect to the orbital debris environment of, for example, a 25.5 year disposal rather than a 25 year disposal is very small and does not justify additional cost. NASA Comments at 7. See also Boeing Comments at 31 (stating that no reason exists to preclude satellite operators from considering the potential impacts of solar activity); Global NewSpace Operators Comments at 16 (stating that a standardized tool taking into account the solar cycle, atmospheric density fluctuations and calculation of the spacecraft's ballistic coefficients is key to accurately predicting de-orbit times).

³¹⁶ Notice, 33 FCC Rcd at 11373, para. 59.

³¹⁷ Boeing Comments at 32. Intelsat states that a broadcast beacon and/or corner reflector equipment could be used for continued passive tracking of the satellite until disposal commences. Intelsat Comments at 7. We encourage use of such enhancements to enable passive tracking during the post-mission period, but do not adopt rules related to their use at this time.

³¹⁸ Boeing Comments at 32-33.

³¹⁹ Iridium Comments at 9-10. See also Aerospace Comments at 17 (stating that consideration of collision avoidance and collision risk should be the responsibility of an operator for the entire period that a system is in orbit, including post-mission).

³²⁰ Satellite DFR states that from a debris perspective, responsibility for an object on orbit does not end simply because it has stopped operating and suggests that we should define or make clear what we mean by "end-of-life." Satellite DFR Comments at 2. As detailed in this section, we have a number of rules in place to ensure that the operator has planned responsibly to mitigate orbital debris following completion of the space station mission, and it is clear that these rules relate to disposal of the spacecraft. In this context, we find it unnecessary to further clarify the term "end-of-life."

2. Reliability and Post-Mission Disposal

92. In the *Notice*, the Commission considered whether to add to the rules a specific metric for reliability of disposal in order to help us better evaluate the applicant's end-of-life disposal plan.³²¹ The Commission proposed to require that applicants provide information concerning the expected reliability of disposal measures involving atmospheric re-entry, and the method by which the expected reliability was derived.³²² The Commission also sought comment on whether we should specify a probability of no less than a certain standard, such as 0.90, and whether the evaluation should be on an aggregate basis if an operator plans to deploy multiple satellites, for example, in an NGSO constellation.³²³ The Commission also asked whether, for large constellation deployments, a more stringent metric should apply.³²⁴ The revised ODMSP states that the probability of successful post-mission disposal should be no less than 0.9, with a goal of 0.99 or better,³²⁵ and further states that each spacecraft in a large constellation of 100 or more operational spacecraft should have a probability of successful post-mission disposal at a level greater than 0.9 with a goal of 0.99 or better.³²⁶

93. The majority of commenters addressing the issue agree with the Commission revising its rules to incorporate a standard for reliability of disposal. While the Commission sought comment on a broader design and fabrication reliability standard as well, many commenters suggest that focusing on disposal reliability is a more effective way to minimize the long-term impact of failed satellites on the orbital environment.³²⁷ With respect to the specific metric, NASA notes that it currently employs a 0.9 disposal reliability for individual spacecraft not part of a constellation, and, consistent with the revisions to the ODMSP, states that inter-agency discussions have concluded that constellations (100 or more spacecraft) should have a post-mission disposal reliability of greater than 0.9.³²⁸ NASA goes on to state that large constellations (1000 or more spacecraft) should have a post-mission disposal reliability goal of 0.99 or better.³²⁹ A number of commenters agree with a tiered approach to reliability, specifically, with a 0.9 reliability for individual satellites and a higher reliability for individual satellites that are part of a constellation.³³⁰

³²¹ *Notice*, 33 FCC Rcd 11369, para. 46.

³²² *Id.*

³²³ *Id.*

³²⁴ *Id.*

³²⁵ ODMSP at 4-2.

³²⁶ ODMSP at 5-1.a. The revised ODMSP further states that for large constellations, in determining the successful post-mission disposal threshold, factors such as mass, collision, probability, orbital location, and other relevant parameters should be considered. *Id.*

³²⁷ *See, e.g.*, NASA Comments at 6; Global NewSpace Operators Comments at 12; CSSMA Comments at 15. We note that reliability of the spacecraft design (i.e. likelihood of a satellite failure) is still relevant in several other specific contexts; reliability of maneuverability systems as a factor in assessing collision risk, ability of the satellite to conduct maneuvers necessary for a controlled re-entry, and trackability, to the extent that trackability is dependent upon deployment of spacecraft with components such as solar arrays.

³²⁸ NASA Comments at 6.

³²⁹ NASA Comments at 6. NASA notes that its recent study for large constellations, assuming constellations totaling approximately 8000 spacecraft at operational altitudes above 1000 km maintained over multiple years, concluded that post-mission disposal reliability should be no less than 0.99 to keep the debris population increase in low-Earth orbit close to an acceptable level for 200 years. *Id.* *See* J.-C. Liou, et. al., "NASA ODPO's Large Constellation Study" NASA Orbital Debris Quarterly News, Volume 22, Issue 3 at 4-7 (Sept. 2018), <https://www.orbitaldebris.jsc.nasa.gov/quarterly-news/pdfs/odqnv22i3.pdf> (NASA Large Constellation Study).

³³⁰ *See, e.g.*, Boeing Comments at 26-27; OneWeb Comments at 28; LeoSat Comments at 6; Global NewSpace Operators Comments at 12; Aerospace Comments at 13-14, 15; Boeing Reply at 33 (citing NASA Comments at 6).
(continued....)

94. We conclude that a baseline post-mission disposal reliability of 0.90 is appropriate for individual NGSO space stations,³³¹ and that larger systems will be evaluated on a case-by-case basis for whether a higher per-spacecraft disposal reliability standard is necessary to avoid significant long-term impacts to the orbital environment. The rule adopted specifies that NGSO applicants provide a demonstration that the probability of successful post-mission disposal is 0.9 or greater for any individual space station.³³² Consistent with the general approach taken in the revised ODMSP,³³³ the rule further states that for space systems consisting of multiple space stations, the demonstration should include additional information regarding efforts to achieve a higher per-spacecraft probability of successful post-mission disposal, with a goal of 0.99 or better for large systems.³³⁴ Under this approach, particular scrutiny will be given to larger deployments, including consideration of factors such as mass, collision probability, and orbital location.³³⁵ We believe this method will avoid some of the concerns associated with arbitrary cutoffs of numbers of space stations, and will allow assessment of acceptable post-mission disposal reliability taking into account all relevant factors.³³⁶

95. Many commenters disagree with applying a disposal reliability standard in the aggregate.³³⁷ NASA recommends the use of a reliability metric expressed on a per-satellite basis.³³⁸ For purposes of post-mission disposal reliability, we agree that the target probability of successful post-mission disposal is best expressed on a per-satellite basis rather than in the aggregate. However, and as recognized in the ODMSP, consideration of the risks presented by deployment of large numbers of satellites supports higher per-satellite reliability, particularly for deployments involving larger numbers of satellites.

96. For purposes of calculating the probability of successful post-mission disposal, we define successful post-mission disposal for spacecraft in LEO as re-entry into the Earth's atmosphere within 25

(Continued from previous page)

Boeing also concurs with NASA's conclusion that a reliability of 0.999 should never be required because it will not provide much additional benefit and may not be achievable, at least not in an affordable manner. Boeing Reply at 33. According to Boeing, the higher metric for individual satellites in a large constellation should not exceed 0.95, and the reliability factor for individual NGSO satellites in smaller constellations should not exceed 0.90. Boeing Comments at 27. *See also* Telesat Comments at 7-8 (arguing that while satellite operators should strive to satisfy 0.95 disposal reliability per satellite, mandatory compliance with this standard would be premature); ORBCOMM Comments (stating that the suggested guideline of 0.99 for post-mission reliability may be appropriate). *See also* Boeing Apr. 16, 2020 *Ex Parte* Letter at 3 (advocating consideration of the reliability metric as part of a further notice of proposed rulemaking).

³³¹ We apply this reliability metric to both NGSO space stations that would operate in LEO and those operating above LEO. *See Notice*, 33 FCC Rcd at 11372, para. 57 (seeking comment on whether there are any specific guidelines we should include in our rules with respect to practices for disposal of NGSO satellites in orbits above LEO).

³³² Appendix A, Final Rules. We also note that the terms "post-mission disposal reliability" and "probability of successful post-mission disposal" have the same meaning and are used interchangeably in this Order.

³³³ ODMSP at 5-1.a.

³³⁴ Appendix A, Final Rules.

³³⁵ *See* ODMSP 5-1.a.

³³⁶ SpaceX suggests that if operators should provide detailed plans regarding disposal on a per satellite basis. SpaceX states that, for example, if an operator plans to rely on fault tolerances, the operator should explain whether it plans to de-orbit its satellites when it reaches a zero-fault threshold. SpaceX Comments at 13. This type of explanation could be part of a demonstration of reliability of the chosen disposal method.

³³⁷ *See, e.g.*, NASA Comments at 6; Telesat Comments at 8 (stating that it would make it impossible to deploy innovative new LEO constellations supporting global coverage).

³³⁸ NASA Comments at 6.

years or less following completion of the spacecraft mission. We recognize that consistent with the discussion above on post-mission lifetime, 25 years will in almost all instances be a longer period than the planned post-mission lifetime of the spacecraft.³³⁹ We believe this is an appropriate balance, however, by giving operators options to meet a performance-based post-mission disposal reliability standard while mitigating the long-term impact of spacecraft failures on the orbital environment.³⁴⁰ Absent unusual circumstances, this would allow spacecraft and systems deployed at low altitudes to achieve a 100% probability of successful post-mission disposal even if the satellites themselves fail immediately upon deployment.³⁴¹ We observe that at lower deployment altitude, however, a high percentage of failed satellites could result in a high collision risk for a system as a whole.

97. Global NewSpace Operators suggests that the Commission should not be prescriptive in how applicants meet post-mission disposal reliability requirements but should instead encourage innovative approaches to how this problem is solved.³⁴² We agree and expect that operators would include in their demonstration, for example, a description of any backup mechanisms or system redundancies that should be factored into assessment of post-mission disposal reliability.³⁴³

98. We note that at some point, a very high level of reliability becomes difficult to achieve absent extraordinary cost and effort.³⁴⁴ We also note that in some instances, development of the spacecraft is likely to be a rapidly iterative process, involving more in-orbit testing than ground testing. In these scenarios, lower deployment altitudes may be required in order to achieve a post-mission disposal reliability consistent with the public interest. In other cases, where the applicant has demonstrated significant ground-based testing commensurate with a high reliability, the lower deployment altitudes may not be as significant a consideration.

99. Operators of large constellations replenishing on a regular basis or otherwise deploying a system through multiple launches should strive to improve reliability with each successive deployment,

³³⁹ We also adopt a conforming rule regarding post-mission disposal reliability applicable to small satellites that would qualify for the part 25 streamlined process. *See* Appendix A, Final Rules.

³⁴⁰ *See, e.g.,* Hugh G. Lewis, *Evaluation of debris mitigation options for a large constellation*, First International Orbital Debris Conference (2019), available at <https://www.hou.usra.edu/meetings/orbitaldebris2019/orbital2019paper/pdf/6069.pdf> (concluding that positioning a percentage of a sample satellite constellation at a 550 km orbital altitude rather than 1100 km reduced the need for a high post-mission disposal success rate in order to limit a longer-term increase in population of debris, but acknowledging that there may be additional burdens on collision avoidance at lower altitudes).

³⁴¹ CSSMA, for example, suggests a post-mission disposal success rate of 1.0 for spacecraft operating below 650 km. CSSMA Reply at 13-14. Lockheed states that “requiring a specific probability of success appears arbitrary and unnecessary” for spacecraft deorbiting through atmospheric drag, Lockheed Comments at 13, but CSSMA notes that there may be non-propulsive spacecraft that rely on atmospheric drag that will need to be below 650 km to meet applicable post-mission lifetime requirements. CSSMA Reply at 13-14. This also addresses the concern expressed by University Small-Satellite Researchers regarding specifying a method of determining disposal reliability. University Small-Satellite Researchers Reply at 6. Since many academic and scientific missions deploy below 600 km altitude, and an increasing number may deploy below 400 km, those missions would be able to point to that fact in order to satisfy the post-mission disposal reliability requirement.

³⁴² Global NewSpace Operators Comments at 11-12.

³⁴³ *See also* McKnight Comments at 4 (stating that it is important that space systems show an ability to react to and operate through anomalies).

³⁴⁴ *See, e.g.,* ORBCOMM Comments at 12 (stating that satellite manufacturers and operators should be encouraged to follow established industry quality and reliability practices by rigorously testing spacecraft and systems on the ground, as well as follow established pre-operational on-orbit testing, but noting that satellites system failures can and do occur regardless of the diligence in designing, fabrication, and testing); Boeing Comments at 27 (stating that 0.95 is the maximum of what is achievable for satellites that employ lengthy and often complex disposal sequences, such as using multiple electric propulsion maneuvers).

since it appears such improvements may have significant impact on the longer-term debris environment.³⁴⁵ Related to this point, Iridium suggests that the Commission require all operators of space stations above 400 km to notify the Commission of any on-orbit satellite failures, whether such failures occur before or during operations.³⁴⁶ According to Iridium, once an operator makes such a notification, the Commission should require the operator to identify and correct the root causes of failure on the ground prior to launching any additional satellites.³⁴⁷ Other commenters similarly request that the Commission address how it will verify compliance with operator disclosures on post-mission reliability and other issues.³⁴⁸ In instances where an applicant for a system consisting of multiple satellites submits information that the expected total probability of collision, post-mission disposal reliability, or casualty risk is close to the acceptable threshold, the Commission will require, as an initial condition of the license, that, in case a rate of failure that would result in values above the risk threshold(s) described in the application is observed, such occurrence be reported to the Commission. The Commission could also require reporting as a result of information that comes to the attention of the Commission during the licensee's operations. In appropriate circumstances, the Commission could subsequently modify the license in accordance with Section 316 of the Communications Act³⁴⁹ to address a rate of failure that departs materially from the expected reliability level, since that departure would affect the public interest assessment underlying grant of the license.

a. Deployment Orbit

100. *Initial Deployment Below 650 km.* The Commission sought comment on whether applicants for space stations in LEO certify that the satellites that will operate at an altitude of 650 km or above would be initially deployed into an orbit at an altitude below 650 km and then, once it was established that the satellites had full functionality, they could be maneuvered up to their planned operational altitude.³⁵⁰ The Commission reasoned that this may help to ensure that if satellites are found to be non-functional immediately following deployment, the satellites would re-enter the atmosphere within 25 years.³⁵¹

101. Commenters addressing this issue generally disagree with the *Notice* proposal.³⁵² NASA recommends that a post-mission disposal reliability metric be adopted rather than requiring an initial

³⁴⁵ See D. Gates, et. al., "An Extended Parametric Study of the Effects of Large Constellations on the Future Debris Environment," *Orbital Debris Quarterly News*, vol. 23, issue 3, at 7 (2019) (stating that to decrease the number of debris over the long-term, it is in the best interest of constellation operators to continuously improve the post-mission disposal rate of their spacecraft over time).

³⁴⁶ Iridium Comments at 5.

³⁴⁷ *Id.*

³⁴⁸ See Global NewSpace Operators Comments at 22 (urging the Commission to outline how it intends to monitor licensee activities and specify methods of enforcement); Secure World Foundation Comments at 6 (noting that a critical part of limiting orbital lifetimes or requiring post-mission disposal is the ability to monitor whether or not a licensee has complied with those requirements); SpaceX Comments at 12 (stating that an effective enforcement structure should encourage operators to report immediately whenever debris is generated); OneWeb Comments at 28 (stating that any failure or anomaly of propulsion systems on demonstration spacecraft should be reported to and reviewed by the responsible regulator). See also D-Orbit Comments at 2 (suggesting that reliability should be re-assessed after a critical event is experienced by a satellite, and if the reliability level at that point is lower than the required threshold, the satellites shall be decommissioned even if the declared end-of-life is not reached).

³⁴⁹ 47 U.S.C. § 316.

³⁵¹ *Id.* at 11370, para. 48.

³⁵² See, e.g., Telesat Comments at 8; ORBCOMM Comments at 12; Lockheed Martin Comments at 13; Boeing Comments at 27-28; OneWeb Comments at 24-25. In its comments, the United Church of Christ agreed with this

(continued....)

deployment altitude below 650 km, stating that the lower deployment would add to the complexity of the deployment of spacecraft and not significantly reduce risk.³⁵³ Other commenters suggested that this would create additional difficulties in development of a constellation and meeting of milestones, without significant benefits, and that the goal of reducing dead-on-arrival satellites could be met by other means.³⁵⁴ We decline to adopt a uniform requirement that NGSO satellites deploy first to 650 km and then raise their orbits to deployment altitude. We conclude that reliability of post-mission disposal and collision risk standards we adopt here more effectively address the same underlying issues regarding the long-term impact of non-functional satellites on the orbital environment.³⁵⁵ It should be noted, however, that in order to achieve post-mission disposal reliability objectives, the use of this strategy may be necessary, particularly for deployments involving larger numbers of satellites.

102. *Testing.* The Commission also sought comment on whether applicants for large NGSO constellations should be required to test a certain number of satellites in a lower orbit for a certain number of years before deploying larger numbers of satellites, in order to resolve any unforeseen flaws in the design that could result in the generation of debris.³⁵⁶ Several commenters pointed out that operators of new constellations of NGSO satellites have conducted testing of a few satellites to verify their performance before launching larger numbers.³⁵⁷ Boeing suggests that the Commission should not dictate the length of such test operations, since operators are usually able to determine fairly quickly whether satellites are operating as intended or whether any anomalies are apparent that may necessitate an extended period of monitoring. Other commenters agree that operators should be able to set their own timelines for in-orbit testing.³⁵⁸ Boeing further argues that operators have sufficient incentives to employ a testing approach to avoid the significant costs that would result from an unanticipated fault affecting a large number of satellites.³⁵⁹ OneWeb contends that required testing could impact an operator's ability to comply with the Commission's NGSO milestone rules.³⁶⁰

103. We observe that there are tradeoffs with different testing modalities, and we expect that there will be some systems that will undergo a rapidly iterative development process following initial deployments. In such cases, those operators should consider deploying at lower altitudes and with smaller numbers of satellites, to ensure minimal impact on the orbital debris environment. We agree with those commenters suggesting that it may be difficult to fully determine on the ground how a satellite will perform in the space environment. As Boeing points out, several operators of planned NGSO systems have launched test satellites, usually consisting of just a few satellites, prior to any larger deployment.³⁶¹

(Continued from previous page) _____
proposal, on the basis that the benefits from the continued viability of LEO would outweigh the costs of orbit-raising. United Church of Christ Comments at 3 (rec. April 3, 2019).

³⁵³ NASA Comments at 7.

³⁵⁴ See, e.g., OneWeb Comments at 24-25; Telesat Comments at 8; LeoSat Comments at 6-7; Lockheed Martin Comments at 13-14.

³⁵⁵ Global NewSpace Operators suggests that the Commission ensure that the license applicant has a pathway to deorbit should their satellite(s) malfunction, regardless of altitude. Global NewSpace Operators Comments at 13. We address these issues in the section below on automatic disposal.

³⁵⁶ Notice, 33 FCC Red at 11370, para. 48.

³⁵⁷ See, e.g., Boeing Comments at 28.

³⁵⁸ See, e.g., Global NewSpace Operators Comments at 3 (stating that the commission will not have the technical insight to know how long is enough for testing of various satellite technologies in orbit, and industry should lead in determining the right parameters to ensure its satellite technology is truly functional).

³⁵⁹ See Boeing Reply at 32, 35.

³⁶⁰ OneWeb Comments at 25-26.

³⁶¹ Boeing Comments at 27-28.

We believe the economic incentives are aligned to a certain extent to encourage such testing by operators of larger systems, given the costs involved in launching satellites. We may also revisit the basis for an applicant's license grant should it become evident that the licensee's satellite performance with respect to orbital debris mitigation is not consistent with what was specified in the application.³⁶² In appropriate circumstances, the Commission could subsequently modify the license in accordance with Section 316 of the Communications Act to address risks that depart materially from the expected level of risk or reliability, since that departure would affect the public interest assessment underlying grant of the license.³⁶³ We therefore at this time do not see the need for a regulatory specification regarding how much testing should be done before a certain level of constellation deployment. As discussed above, we expect that operators will be testing systems related to satellite disposal as well, and, if the operators conclude after deployment of a few satellites that they are not able to meet the reliability for post-mission disposal specified in their application, the operators will make changes to these systems to ensure that the required reliability is achieved.³⁶⁴

b. Automatic Initiation of Disposal

104. In the *Notice*, the Commission proposed that applicants seeking to operate NGSO space stations should provide a statement that the spacecraft disposal will be automatically initiated in the event of loss of power or contact with the spacecraft, or describe other means to ensure that reliability of disposal will be achieved, such as internal redundancies, ongoing monitoring of the disposal function, or automatic initiation of disposal if communications become limited.³⁶⁵ The Commission also sought comment on the costs and benefits associated with these design features.³⁶⁶ After review of the record, we decline to adopt any regulations at this time with respect to automatic de-orbit.

105. Most commenters addressing this issue disagreed with the Commission's proposal,³⁶⁷ although some expressed support.³⁶⁸ Commenters generally felt that a rule on this topic would not adequately address the wide range of factual scenarios involved in disposal operations,³⁶⁹ that

³⁶² In an *ex parte* filing, Viasat urges us to consider measures such as regular assessments to determine that satellite in large systems are achieving stated application metrics, such as for collision risk, arguing that economies of scale mean there are low economic barriers to space. Viasat Apr. 10, 2020 *Ex Parte* Letter at 3. We decline to adopt these specific requirements at this time with respect to collision risk given that we are continuing to assess collision risk as part of the Further Notice.

³⁶³ See Iridium *Ex Parte* Letter, Attach. at 7-8 (stating that for larger systems, any design flaws should be identified and fixed before launches continue).

³⁶⁴ See, e.g., OneWeb Comments at 25-26 (proposing that satellites of new design should be launched in limited numbers and if a systematic problem is experienced, subsequent launches should be postponed until resolution is identified and implemented on subsequent satellites).

³⁶⁵ *Notice*, 33 FCC Rcd at 11370, para. 49.

³⁶⁶ *Id.* at 11370, para. 50.

³⁶⁷ See, e.g., Lockheed Martin Comments at 14; Telesat Comments at 8; LeoSat Comments at 7-8; Boeing Comments at 28-29; OneWeb Comments at 26; ORBCOMM Reply at 3; Boeing Reply at 36-37; University Small-Satellite Researchers at 7, 11; CSSMA Reply at 14.

³⁶⁸ See, e.g., D-Orbit Comments at 3. D-Orbit suggests that use of autonomous, rather than automatic de-orbiting devices would provide operators with the desired control over their spacecraft. *Id.*

³⁶⁹ Some commenters argue that autonomous deorbit could complicate operations and have negative consequences, including potentially increased risk of collisions. See, e.g., Telesat Comments at 8; OneWeb Comments at 26; Lockheed Martin Comments at 14; Aerospace Comments at 14-15; LeoSat Comments at 7-8; ORBCOMM Comments at 17-18; Global NewSpace Operators Comments at 13; Boeing Reply at 36. NASA recommends that failsafe or automatically initiated disposal actions carefully examine associated risks, including unintended consequences. NASA Comments at 7.

technologies for automatic disposal are not sufficiently developed,³⁷⁰ or that autonomous systems may not provide true redundancy, which satellite operators already incorporate into their designs.³⁷¹ Several commenters suggest future work in this area may be appropriate.³⁷² One commenter suggests use of autonomous decommissioning devices on the satellite that would duplicate critical functions of the spacecraft.³⁷³ It states that such a device could ensure absolute capability to perform decommissioning maneuvers, and would avoid investment in re-designing the satellite platform itself.³⁷⁴ Although we decline to adopt a specific requirement for automatic initiation of disposal, we note that such operations could factor into the review described above with respect to post-mission disposal reliability.³⁷⁵ For example, to the extent that such devices can improve such reliability by way of back-up and redundancy, they can be considered.³⁷⁶ We observe that the development of robustly reliable autonomous systems could help to establish a high-level of reliability for post-mission disposal, but we will consider such technologies on a case-by-case basis.

c. Direct Spacecraft Retrieval

106. The Commission sought comment in the *Notice* on what weight, if any, the Commission should give to post-mission disposal proposals relying on direct spacecraft retrieval, i.e., the use of one spacecraft to retrieve another from orbit.³⁷⁷ As discussed in the *Notice*, this also includes activities referred to as “active debris removal”. The Commission observed in the *Notice* that there are a number of specific technologies under development for direct spacecraft retrieval, and sought comment on whether it should be considered as a valid debris mitigation strategy in certain circumstances.³⁷⁸ We observe that the revised ODMSP provides for direct retrieval of a structure preferably at the completion of the mission, but no more than 5 years after completion of mission.³⁷⁹ The revised ODMSP also provides that active debris removal operations should follow the objectives generally applicable to other operations.³⁸⁰

³⁷⁰ See, e.g., Aerospace Comments at 15.

³⁷¹ Boeing Reply at 36.

³⁷² University Small-Satellite Researchers urge that we address the issue of automatic de-orbit in further proceedings once it has been demonstrated that the benefits outweigh the costs or a further record on the availability of novel disposal systems has been developed. University Small-Satellite Researchers Reply at 11. ORBCOMM suggests that a further examination of these concepts in a further notice of proposed rulemaking appears necessary to determine if automatic de-orbit regulation is useful, practical, or feasible. ORBCOMM Comments at 18. Given the record developed in this proceeding, we conclude that it does not make sense to adopt any regulations on this topic at the current time, and, while we decline to include this issue in the Further Notice below, we do not rule out re-visiting this concept at a later time.

³⁷³ D-Orbit Comments at 3. D-Orbit suggests that use of autonomous, rather than automatic de-orbiting devices would provide operators with the desired control over their spacecraft. *Id.*

³⁷⁴ D-Orbit Comments at 3.

³⁷⁵ See D-Orbit Comments at 2 (suggesting that use of autonomous decommissioning devices can contribute to achieving and maintaining the threshold of reliability because it shifts the need to assess the reliability of the satellite to the assessment of the reliability of the device); Global NewSpace Operators Comments at 14 (stating that the Commission should consider applicants favorably that have backup deorbit devices so long as it is effective to remove within 25 years or lower, but suggesting that other means may be better to improve post-mission reliability for spacecraft in higher orbits).

³⁷⁶ See Global NewSpace Operators Comments at 14 (suggesting that for larger satellite constellations even below 650, some backup means of disposal should be encouraged).

³⁷⁷ *Notice*, 33 FCC Red at 11371, para. 53.

³⁷⁸ *Id.* at 11371, paras. 53-54.

³⁷⁹ ODMSP, 4-1.f.

³⁸⁰ ODMSP, 5-4.

107. We generally agree with those commenters stating that it would be premature to establish more detailed regulations in this area.³⁸¹ To the extent that any applicants seek to rely on direct retrieval as a means to dispose of their spacecraft, the plan may be considered on a case-by-case basis, keeping in mind that the technology would need to be sufficiently developed at the time of the application for the Commission to be able to assess the reliability of the disposal method.³⁸² Although the technology for direct retrieval is not sufficiently developed for commercial applications at the moment, in the future this type of technology may enable some missions that would not otherwise be possible currently.³⁸³

3. MEO Disposal

108. In the *Notice*, the Commission sought comment on whether to include provisions in the rules regarding disposal of certain NGSO satellites operating in orbits above LEO.³⁸⁴ Specifically, the Commission sought comment on whether there were particular practices for post mission disposal above LEO that were sufficiently developed to formalize in our rules.³⁸⁵ We observe that the revised ODMSP addresses disposal of spacecraft in medium-Earth orbit (MEO), defined as the region between the LEO region (below 2,000 km) and the GEO region (between 35,586 and 35,986 km).³⁸⁶ The ODMSP provides options of both long-term storage between LEO and GEO, and removal from orbit using unstable disposal orbits that will result in atmospheric re-entry of the spacecraft.³⁸⁷

109. Several commenters suggest that continuing a case-by-case assessment regarding disposal of spacecraft operating above LEO remains appropriate.³⁸⁸ Aerospace provides some additional

³⁸¹ See, e.g., Boeing Comments at 30; OneWeb Comments at 27; Iridium Comments at 10; Aerospace Comments at 15-16. See also Lockheed Martin Comments at 14-15 (combining the discussion of direct retrieval with the discussion of disposal of spacecraft operating between LEO and GEO). As NASA points out, SPD-3 states that the “United States should pursue active debris removal as a necessary long-term approach to ensure the safety of flight operations in key orbital regimes [and] this effort should not detract from continuing to advance international protocols for debris mitigation associated with current programs.” NASA Comments at 7 (quoting SPD-3).

³⁸² See Satellite DFR Comments at 2 (absent a solid demonstration of successful retrievals, operators should not be permitted to substitute retrieval in lieu of an effective post-mission disposal plan using the satellite’s onboard systems); Global NewSpace Operators Comments at 14-16 (describing a number of current technologies under development for either backup deorbit systems or deorbit “tugs.”). To the extent that direct retrieval could serve as a backup means of disposal, for example, by the inclusion of a magnetic plate or grapple fixture on a spacecraft, we could include that in our consideration of the reliability of post-mission disposal, but the technology would need to be sufficiently developed for the Commission to assess it as a component of reliability. See, e.g., Global NewSpace Operators Comments at 16 (urging the Commission to consider appropriate ways to encourage applicants to evaluate and incorporate backup deorbit systems, capture interfaces and other cooperative servicing aids, and transponder beacons into their spacecraft or constellation’s post-mission disposal plans, instead of relying solely on the assumption that their spacecraft will never fail). See also OneWeb Comments at 27 (stating that OneWeb plans to include a grapple fixture and fiducials on every NGSO spacecraft to facilitate capture and encourage standardization of interfaces); Aerospace Comments at 16 (stating that it is prudent to include grapple fixtures, radar corner reflectors, and optical reflectors in spacecraft designs even if there is no active plans for retrieval); Satellite DFR Comments at 2 (stating that operators should be required to design their satellites for recovery including documentation for retrieving those that fail to deorbit as planned).

³⁸³ Other commenters raise issues related to direct retrieval that are outside the scope of this proceeding. See Secure World Foundation Comments at 5 (proposing programmatic initiatives to foster active debris removal); Satellite DFR Comments at 3 (suggesting global and national initiatives to advance active debris removal).

³⁸⁴ *Notice*, 33 FCC Red at 11372, para. 56.

³⁸⁵ *Id.* at 11372, para. 57.

³⁸⁶ ODMSP at 4-1.e.

³⁸⁷ ODMSP, 4-1c.e.

³⁸⁸ See, e.g., Telesat Comments at 8; Lockheed Martin Comments at 14-15.

technical detail regarding options for disposal above LEO, as well as with respect to high-eccentricity disposals.³⁸⁹ We will continue to assess disposal for spacecraft operating between LEO and GEO on a case-by-case basis. This includes those systems that would be considered to be operating in MEO as well as in highly-elliptical orbits (HEO). Applicants for such spacecraft should identify the planned method of disposal and explain their plans.³⁹⁰ In developing a description of the planned disposal, applicants should be aware of and address the issues described in Objective 4 of the ODMSP, including, for example, limiting collision risk, and limiting time spent by the spacecraft in certain zones.³⁹¹ Applicants should also discuss the rationale for the selected disposal strategy. We observe that compared to storage strategies, which result in risk of debris generation that lasts essentially forever, the removal of satellites from orbit using eccentricity growth reduces the risk of debris generation over the long-term.³⁹² This strategy should therefore be seriously considered by mission designers.

F. GSO License Extensions and Related Issues

110. *Assessment of Request for Extension.* In the *Notice*, the Commission proposed to codify the current practice of requesting certain types of information from GSO licensees requesting license term extensions.³⁹³ The Commission proposed that the rule would specify that the applicants should state the duration of the requested license extension and the total remaining satellite lifetime, certify that the satellite has no single point of failure that could affect its ability to conduct end-of-life procedures as planned, that remaining fuel reserves are adequate to complete deorbit as planned, and that telemetry, tracking, and command links are fully functional.³⁹⁴ The *Notice* noted that in the event that an applicant is unable to make any of the certifications, the applicant could provide a narrative description justifying the extension.³⁹⁵ We adopt the proposed rule, modified to address commenter's concerns with the proposed certification concerning single point failures, as described below.

111. Commenters are concerned that the proposed certification that the satellite has "no single point of failure or other malfunctions, defects, or anomalies during its operations that could affect its ability to conduct end-of-life procedures" could unduly restrict the ability of operators to obtain extensions for satellites with years of useful life remaining and suggest a more flexible, case-by-case approach, as is currently followed.³⁹⁶ We modify our proposed rule on single points of failure or other malfunctions, defects, or anomalies to accommodate a description rather than a certification.³⁹⁷ An operator could specify, for example, that despite a single point of failure, the reliability of post mission

³⁸⁹ Aerospace Comments at 16-17.

³⁹⁰ See Appendix A, Final Rules.

³⁹¹ See ODMSP at 4-1.c, e. We note that Aerospace's comments on this topic also suggest several options for disposal, which overlap in some, but not all respects with the ODMSP. See Aerospace Comments at 16-17.

³⁹² See ODMSP, 4-1,e.

³⁹⁴ *Id.*

³⁹⁵ *Id.*

³⁹⁶ See AT&T Comments at 2-3; Intelsat Comments at 9; Sirius XM Comments at 4; Eutelsat Comments at 5-6; AT&T Reply at 6; Boeing Reply at 39-40; Letter from Jessica B. Lyons, AT&T Services, Inc., Susan H. Crandall & Cynthia J. Grady, Intelsat License LLC, Kimberly M. Baum, EchoStar Satellite Services L.L.C. & Hughes Network Systems, LLC, and Donna Betha-Murphy & Brennan Price, Inmarsat, Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 4 (filed April 2, 2020) (GSO Satellite Operators Apr. 2, 2020 *Ex Parte*). AT&T also states that operators should be entitled to confidential treatment of disclosures. AT&T Comments at 3. We refer to the existing Commission rules providing a means for a party to seek confidential treatment of material submitted to the Commission. See, e.g., 47 CFR § 0.459.

³⁹⁷ See Appendix A, Final Rules.

disposal remains within acceptable levels.³⁹⁸ We will continue our case-by-case approach to assessing requests for license extensions,³⁹⁹ and the descriptive nature of this disclosure will enable an operator to provide additional information about potential risk and disposal reliability.⁴⁰⁰ Additionally, Space Logistics requests that the Commission adopt rules that would permit a GSO space station licensee to extend its satellite license term by the length of any mission extension service in lieu of such certifications.⁴⁰¹ We would also address this under our case-by-case approach.

112. *Limit of 5 Years Per Extension Request.* The Commission proposed in the *Notice* to limit license term extensions to no more than five years in a single modification application for any satellite originally issued a fifteen-year license term.⁴⁰² Currently, the Commission receives license extension requests for varying numbers of years and processes those requests on a case-by-case basis. The Commission tentatively concluded that five years may be an appropriate limit for a single modification to help ensure reasonable predictions regarding satellite health while affording operators some flexibility.⁴⁰³ We adopt this rule as proposed.

113. A number of commenters, primarily operators or manufacturers of existing GSO satellites, oppose a cap on how many years may be requested at a time through an extension request.⁴⁰⁴ Telesat, for example, states that the Commission should continue its current flexible approach because it minimizes regulatory proceedings and costs for the Commission and licensees.⁴⁰⁵ Although the limitation of a single license term extension to five years could potentially result in more modification requests being filed with the Commission as operators seek multiple license extensions, we conclude that the additional costs of preparing an application and paying a modification application fee are outweighed by the benefits of revisiting license extensions within five years—namely, ensuring that the extension continues to be consistent with the public interest by reevaluating the satellite health and functionality information that provides a basis for extending the license term. Lockheed Martin contends that it is not appropriate to limit extensions to five years if a longer term is justifiable based on a review of the

³⁹⁸ Intelsat suggests that instead of a certification related to single points of failure, an applicant certify to a particular de-orbit reliability figure, such as 90% probability of successful de-orbiting. Intelsat Comments at 9.

³⁹⁹ See Astranis Space Technologies Corp. Reply Comments at 6 (rec. May 6, 2019) (stating that the Commission should assess requests on a case-by-case basis); Lockheed Martin Comments at 15 (suggesting that in some instances other information regarding satellite performance metrics may be relevant to the extension inquiry).

⁴⁰⁰ In an *ex parte* filing, Sirius XM asks us to clarify the term “fully functional” as used in the applicant’s statement that telemetry, tracking and command links are “fully functional.” Letter from James S. Blitz, Vice President, Regulatory Counsel, Sirius XM Radio Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket 18-313, at 1-2 (filed April 15, 2020). Specifically, Sirius XM asks whether an operator could certify that telemetry, tracking, and command links are fully functional where system redundancies have permitted continued operations despite a failure in a redundant system. *Id.* We would consider telemetry, tracking, and command links to be fully functional in this particular factual scenario, but would expect that the loss of redundancy in this critical system would be addressed as part of the renewal request, including identifying any known failure modes that might result in failure of the functioning equipment

⁴⁰¹ Space Logistics Comments at 8.

⁴⁰² *Notice*, 33 FCC Rcd at 11375, para. 66.

⁴⁰³ *Id.*

⁴⁰⁴ See, e.g., SIA Comments at 6-7; AT&T Comments at 4; Eutelsat Comments at 5-6; EchoStar/Hughes Comments at 7; Eutelsat Comments at 4-5; Intelsat Comments at 9-11; Lockheed Martin Comments at 15; Telesat Comments at 9; SES/O3b Reply at 7; AT&T Reply at 8; Boeing Reply at 39; GSO Satellite Operators Apr. 2, 2020 *Ex Parte* Letter at 4-5. *But see* Viasat Comments at 8 (agreeing with the Commission’s proposal).

⁴⁰⁵ Telesat Comments at 9. See also Eutelsat Comments at 4-5; Intelsat Comments at 10-11; Lockheed Martin Comments at 15; SIA Comments at 6; AT&T Comments at 4.

provided specifics.⁴⁰⁶ Similarly, SIA argues that a five-year limit would significantly constrict the ability of GSO operators to leverage the full value of their in-orbit assets.⁴⁰⁷ According to SIA, the Commission should continue to permit GSO operators to demonstrate, through the modification application process, that the satellite is capable of continuing to serve the public interest for an appropriate additional term.⁴⁰⁸ We fully recognize that there are satellites capable of providing service well beyond the initial 15-year license term, and in appropriate cases will license those satellites for additional license extensions. Under the approach we adopt here, GSO satellite licenses may be extended for more than five years in total, but the extensions will be granted in increments of five years, at most, through applications for modification.⁴⁰⁹ While GSO space station licensees understandably want to provide service for as long as possible using their existing space station(s), they are not necessarily incentivized to make conservative estimates when requesting license term extensions. The five-year limit per extension will allow for reassessment of satellite health on a regularized basis even for those satellites with longer lifetimes, which serves the public interest.

114. Intelsat argues that the Commission should not limit the duration of license extension requests because in some countries, such as Brazil, landing rights are granted for the term specified in the original U.S. license and only one renewal is permitted, and so the landing rights are limited to the duration of the initial U.S. license term plus the length of the extension.⁴¹⁰ Therefore, Intelsat argues, the Commission's five-year cap on an individual license term extension would limit the maximum period for landing rights in other countries.⁴¹¹ While we appreciate that operators are navigating regulatory processes in other nations as well as the United States, we cannot be responsible for the approach that other countries take with respect to landing rights—and have no control over whether and when another administration attaches significance to Commission decisions. We find that this rule change is in the public interest for the reasons discussed above, and if operators have concerns regarding the approaches of other administrations they should address those issues with the relevant administration(s).

115. Sirius XM asks that we exempt Satellite Digital Audio Radio Service (SDARS) licensees with eight-year license terms from the proposed five-year limit on license extensions.⁴¹² Sirius XM states that it would unfairly disadvantage SDARS licensees since the initial license term for those operations is shorter.⁴¹³ In the *Notice* we proposed that the five-year limit on license extensions would apply to only those satellites with an initial 15-year license term.⁴¹⁴ Given the limited number of SDARS licensees, we will continue the current case-by-case approach to the length of license extensions for these satellites,

⁴⁰⁶ Lockheed Martin Comments at 15. *See also* Boeing Comments at 34; EchoStar/Hughes Comments at 7. We also decline to adopt a maximum of five years as a rebuttable presumption, since this not substantially different from the current approach to assessment of license extensions, and would involve the Commission making additional assessments to predict satellite health more than five years in advance.

⁴⁰⁷ SIA Comments at 6-7.

⁴⁰⁸ *Id.*

⁴⁰⁹ Several operators agree that if we do adopt a five-year license term, we permit multiple extensions. *See* Boeing Comment at 34 (stating that it is appropriate to allow licensees to seek multiple extensions if warranted, given the increasingly long periods that GSO satellites are able to safely operate, particularly with the introduction of new fuel types, such as electronic propulsion); Eutelsat Comments at 4-5.

⁴¹⁰ Intelsat Comments at 10. *See also* SIA Comments at 7 & n.17.

⁴¹¹ Intelsat Comments at 10-11.

⁴¹² *See* Sirius XM Comments at 2-3; Sirius XM Reply at 1-2.

⁴¹³ *See* Sirius XM Comments at 3; Sirius XM Reply at 2. Sirius XM requests that we adopt a first license extension of up to eight years for SDARS licensees and thereafter subject SDARS to the same license extension cap that applies to other satellite services. Sirius XM Comments at 3; Sirius XM Reply at 2.

⁴¹⁴ *Notice*, 33 FCC Red at 11375, para. 66.

rather than imposing the five-year cap. AT&T requests a similar exemption for GSO direct broadcast satellite (DBS) space stations that were initially authorized for a license term of ten years.⁴¹⁵ In a recent Report and Order, we updated the license term for DBS satellites operating on a non-broadcast basis from 10 years to 15 years, and concluded that the few existing non-broadcast DBS licensees that had not already had licenses extended may have their license extended to match a 15-year license term upon application to modify the license.⁴¹⁶ Licensees with an initial term of less than 15 years will also be treated on a case-by-case basis for subsequent extensions, rather than being subject to the five-year cap.⁴¹⁷

116. *Other Issues.* In the *Notice*, the Commission also sought comment on whether there are types of GSO satellite anomalies that should trigger immediate reporting, and whether there were any types of satellite buses that warrant heightened scrutiny for purposes of assessing license extensions.⁴¹⁸ Those commenters addressing these issues disagreed with adoption of rules in either of these areas,⁴¹⁹ and we decline to adopt any new rules on these topics at this time because we think it is unnecessary to adopt specific requirements in this area and can continue to address these issues on a case-by-case basis.⁴²⁰ With respect to GSO anomaly reporting, we observe that GSO operators typically already provide information informally to the Commission regarding anomalies, and the Further Notice seeks comment on incentives for GSO operators to maximize the probability of successful disposal. Additionally, regarding satellite design issues, we continue to expect that operators will disclose issues that may be systematic to a particular GSO satellite design as part of their license extension request—and note that the Commission may consider such systematic issues as they arise and when assessing requests for license extensions under its continued case-by-case approach.

G. Casualty Risk Assessment

117. In the *Notice*, the Commission sought comment on two issues related to the human casualty risk assessment for space stations disposed of by re-entry into Earth's atmosphere. First, the Commission sought comment on whether to update our rules to specify that the human casualty risk assessment⁴²¹ must include all objects that would have an impacting kinetic energy of 15 joules, consistent

⁴¹⁵ AT&T Comments at 5.

⁴¹⁶ *Amendment of the Commission's Policies and Rules for Processing Applications in the Direct Broadcast Satellite Service*, Report and Order, 33 FCC Rcd 9014, 9019, para. 16 (2019) (*DBS Modernization Order*).

⁴¹⁷ We observe that this would not necessarily result in a license term extension of more than five years.

⁴¹⁸ *Notice*, 33 FCC Rcd at 11375, para. 67.

⁴¹⁹ See Lockheed Martin Comments at 15-16 (disagreeing with adoption of rules related to either proposals); Intelsat Comments at 11 (disagreeing with adoption of a rule on anomaly reporting); Sirius XM Comments at 4 (disagreeing with adoption for rule identifying any particular satellite buses).

⁴²⁰ Additionally, one commenter suggests that the GSO graveyard orbit be re-examined due to the potential that there are small debris from the graveyard orbit filtering down in the proximity of operational GSO satellites. McKnight Comments at 2. The Commission had not proposed to examine this issue in the *Notice*, and we decline to do so at this time, but could revisit in the future.

⁴²¹ Lockheed Martin argues that a disposal reliability metric is unnecessary given the casualty risk assessment requirement. Lockheed Martin Comments at 13. The disposal reliability metric does not replicate the casualty risk assessment, however. As explained below, it is design reliability that is implicated in casualty risk in cases where the planned disposal is by targeted re-entry, since an uncontrolled satellite can still be reliably disposed by atmospheric entry, but satellite control in order to conduct a targeted re-entry to minimize casualty risk is a design reliability issue.

with the NASA Standard.⁴²² Commenters generally supported including the 15 joule metric in the Commission's rule.⁴²³ We adopt the proposal.

118. Second, the Commission proposed that where the calculated risk of human casualty from surviving debris is determined to be greater than zero, as calculated using either the NASA Debris Assessment Software or a higher fidelity assessment tool, the applicant must provide a statement indicating the calculated human casualty risk, as well as the input assumptions used in modeling re-entry.⁴²⁴ The Commission further sought comment on whether to assess human casualty risk in the aggregate as well as on a per-satellite basis, and what metric should be used to evaluate such risk.⁴²⁵

119. The revised ODMSP states that for those satellites disposed of by reentry into Earth's atmosphere, "the risk of human casualty from surviving components with impact kinetic energies greater than 15 joules should be less than 0.0001 (1 in 10,000)."⁴²⁶ The ODMSP also states that "[d]esign-for-demise and other measures, including . . . targeted reentry away from landmasses, to further reduce reentry human casualty risk should be considered."⁴²⁷ With respect to "large constellations," the ODMSP states that, "[i]n developing the mission profile, the program should limit the cumulative reentry human casualty risk from the constellation."⁴²⁸

120. At this time, we adopt the approach advocated by some commenters and incorporate the 0.0001 (1 in 10,000) or less human casualty risk metric into our rules for those satellites that would be disposed of by atmospheric re-entry.⁴²⁹ This continues the approach followed in licensing since the adoption in 2004 of debris mitigation rules, and will provide in the codified rules an explicit reference point for applicants, consistent with the ODMSP and NASA Standard. In the Further Notice below we seek additional comment on how the additional ODMSP guidance related to design-for-demise and other measures such as targeted reentry to further reduce human casualty risk should be addressed in our rules, as well as the guidance for large constellations that such constellations limit cumulative reentry human casualty risk.⁴³⁰ Thus, to the extent that some commenters suggest that we should apply a more stringent standard than 1 in 10,000 and consider total casualty risk on a system-wide basis, we address those topics in the Further Notice.

121. Several commenters suggest that NASA's Debris Assessment Software does not account for some potential sources of casualty risk adequately.⁴³¹ NASA updates the Debris Assessment Software casualty risk assessment tool on an ongoing basis, including recently updating the reentry survivability model.⁴³² To the extent that an applicant believes that its satellite design will not be adequately assessed with the Debris Assessment Software tool, it should submit a higher fidelity analysis that provides an improved assessment, and the rule revisions we adopt here are consistent with this approach.

⁴²² Notice, 33 FCC Rcd at 11373, para. 61.

⁴²³ See, e.g., CSSMA Comments at 17; Boeing Comments at 32; Boeing Reply at 38. This is also consistent with the ODMSP. See ODMSP, 4-1.a, b.

⁴³⁰ ODMSP 5-1.b.

⁴³¹ SpaceX Comments at 18; CSSMA Reply at 17.

⁴³² See NASA DAS 3.0 User's Guide at 1.2.1.

H. Proximity Operations

122. In the *Notice*, the Commission noted the increasing number of commercial missions proposed involving proximity operations and rendezvous of spacecraft.⁴³³ The Commission proposed that applicants be required to disclose whether the spacecraft is capable of, or will be, performing rendezvous or proximity operations.⁴³⁴ The Commission also sought comment on whether the rules should include anything more specific regarding information sharing about proximity operations with the 18th Space Control Squadron or any successor civilian entity.⁴³⁵

123. We adopt a disclosure requirement that would identify situations where there are planned rendezvous and proximity operations and provide a vehicle for further review of those operations.⁴³⁶ The disclosure requirement follows the general approach in the revised ODMSP of analyzing such operations within the framework of standard debris mitigation objectives—limiting debris release, preventing accidental explosions, and limiting collision risk.⁴³⁷ Commenters generally supported this approach.⁴³⁸ We note the evolving and developing nature of these operations, and accordingly find that more specific technical or operational requirements are premature at this time.⁴³⁹

I. Encryption and Security of Spacecraft Command

124. In the *Notice*, the Commission proposed a rule requiring that operators of space stations having onboard propulsion systems encrypt telemetry, tracking, and command communications with the space station.⁴⁴⁰ The Commission noted concerns that a malevolent actor could take control of and command satellites.⁴⁴¹ A particular scenario of direct relevance to this proceeding is if the commandeered satellite has propulsion capabilities and can be used to introduce additional debris into the space environment and/or threaten damage to other spacecraft.⁴⁴² Commenters to the *Notice* express a variety of views on whether, and the extent to which, encryption should be undertaken to secure telemetry, tracking,

⁴³³ *Notice*, 33 FCC Rcd at 11375-76, para. 68

⁴³⁴ *Id.*

⁴³⁵ *Id.*

⁴³⁶ See Appendix A, Final Rules.

⁴³⁷ ODMSP at 5-3.

⁴³⁸ See, e.g., Space Logistics Comments at 2, 6-7; Consortium for Execution of Rendezvous and Servicing Operations Comments at 2; Aerospace Comments at 18. Space Logistics states that disclosures regarding on-orbit servicing specifically should be provided in the context of a satellite license application or a modification application of an existing license to operate a “mission extension vehicle” with a different client vehicle. Space Logistics Comments at 6, n.13. As adopted, the disclosure regarding such operations would be an application requirement, and would also be required of any operators as part of a license modification, if the modification involved such operations.

⁴³⁹ Several commenters note the work of the Consortium for Execution of Rendezvous and Servicing Operations in developing best practices. See Consortium for Execution of Rendezvous and Servicing Operations Comments at 1-2; Space Logistics Comments at 7; Secure World Foundation Comments at 6-7; Global NewSpace Operators Comments at 17; Intelsat Comments at 7.

⁴⁴⁰ *Notice*, 33 FCC Rcd at 11377-78, paras. 74-75, Appendix A, Proposed Rules.

⁴⁴¹ *Id.* (citing A. Kurzrok, M. Diaz Ramos, and F.S. Mechentel, “Evaluating the Risk Posed by Propulsive Small-satellites with Unencrypted Communications Channels to High-Value Orbital Regimes,” 32nd Annual AIAA/USU Conference on Small Satellites, at 1 (2018); Eleni M. Sims and Barbara M. Braun, “Navigating the Policy Compliance Roadmap for Small Satellites,” The Aerospace Corporation, at 9 (2017)).

⁴⁴² *Notice*, 33 FCC Rcd 11378, paras. 74-75. See Global NewSpace Operators Comments at 18-19 (stating that the Commission should provide more specificity on the risk it seeks to mitigate and how the risk relates to orbital debris mitigation).

and command links, both for spacecraft with propulsion and those without. While many recognize the need for securing commands, many also raise concerns about mandating the use of specific encryption standards.⁴⁴³ Based on the record established in this proceeding, we adopt a clarifying update to our existing rule on control of transmitting stations and the security of command communications applicable to commercial systems.⁴⁴⁴ We decline at this time to specifically include in our rules the more detailed and prescriptive security measures outlined in some comments, such as requiring use of a specific encryption standard.⁴⁴⁵

125. Several commenters point out that most satellites do not have sufficiently precise guidance and navigation capabilities to be used effectively by a malevolent actor to target and collide with other satellites, thereby causing debris.⁴⁴⁶ At orbital velocities, the capabilities necessary to present a credible threat require advanced systems at a level of technical sophistication well beyond what is commonly deployed, particularly in typical low-cost small satellite missions. For this reason, we are not adopting the proposed rule focusing on those satellites with propulsion systems.

126. Many of the comments focus more generally on the issue of securing command communications. A number of commenters argue that the Commission should not impose detailed encryption requirements, particularly those tied to a single standard, because satellite operators already have sufficient incentives to protect their space assets through encryption and other methods for restricting access only to authorized users.⁴⁴⁷ We agree that given the diversity of satellite operations, requiring the use of a one-size-fits-all encryption standard is not appropriate at this time,⁴⁴⁸ and will continue to address concerns related to securing facilities through existing high-level performance

⁴⁴³ See, e.g., SiriusXM Comments at 8; ORBCOMM Comments at 13; CSSMA Comments at 19-20.

⁴⁴⁴ Section 25.271 specifies requirements for “control of transmitting stations,” including that the licensee ensure that the facilities are properly secured against unauthorized access or use whenever an operator is not present at the transmitter. 47 CFR § 25.271(d). We make a minor update to this rule to clarify that for space station operations, this includes securing satellite commands against unauthorized access and use. See Appendix A, Final Rules, 25.271(a). A number of commenters identify the importance of securing command communications specifically. See, e.g., Viasat Comments at 2; Eutelsat Comments at 6 (stating that if the Commission were to impose requirements, they should be limited to command signals only); see also Maxar Comments at 14 (supporting command and control encryption/authentication requirement); Tyvak Reply at 2 (supporting protection of command uplinks); AMSAT Comments at 7-8 (stating that in the amateur context, command, rather than telemetry or tracking communications, may be encrypted).

⁴⁴⁵ See, e.g., Providence Access Company Comments at 7, 10-11 (rec. April 4, 2019).

⁴⁴⁶ See Aerospace Corp. Comments at 18 (estimating that it would extraordinarily difficult to commandeer a satellite and use it to intentionally harm another spacecraft if it were not designed to do so); CSSMA Comments at 19 (arguing that a malevolent actor taking control of an unsecured satellite is ultimately a very unrealistic scenario); Boeing Reply at 42-43 (agreeing with other parties that it would be extremely difficult for an authorized party to commandeer a satellite and cause it to harm any other space objects).

⁴⁴⁷ See, e.g., Boeing Comments at 36-37; AT&T Comments at 36-37; AT&T Reply at 11. See also Intelsat Comments at 11-12 (noting that operators are already subject to specific encryption obligations in certain situations, and encryption can result in extended service outages in the case of on-orbit anomalies with a TT&C system).

⁴⁴⁸ Several commenters referenced the existing Federal cybersecurity policy that is applicable to commercial space systems supporting national security missions, the Committee on National Security Systems Policy 12 (CNSSP-12), Cybersecurity Policy for Space Systems Used to Support National Security Missions (February 2018), available at <http://www.cnss.gov/cnss/issuances/Policies.cfm>. See Charles Clancy and Jonathan Black Comments at 1-2 (rec. April 5, 2019) (Clancy and Black Comments); Providence Access Company Comments at 6-8. Commenters note, however, that it is not realistic to expect all licensees to demonstrate that they are using National Security Administration-approved means for securing command communications. See, e.g., Clancy and Black Comments at 1-2.

obligations identified in FCC rules.⁴⁴⁹ As a matter of clarification, we are including specific language in the relevant part 25 rule to indicate that the rule applies to space stations.⁴⁵⁰ We also encourage experimental and amateur licensees to continue to ensure that they are in full compliance with the Commission's existing rules applicable to experimental⁴⁵¹ and amateur licensees regarding control of transmitting stations.⁴⁵²

127. We recognize that the discussion regarding the security of TT&C communications is only one element of the broader topic of cybersecurity for satellite and ground station operations. There has been increasing discussion within the satellite industry regarding the importance of securing communications links.⁴⁵³ Commenters suggest that there is need for additional guidance and best practices on cyber security or cyber resiliency for satellite systems.⁴⁵⁴ Consideration of cybersecurity is an important part of their overall system development, and we encourage all operators to do so, including by following industry-developed best practices and government guidance, where applicable.⁴⁵⁵

⁴⁴⁹ See 47 CFR § 25.271; *Notice*, 33 FCC Rcd at 11377, para.74, n.172.

⁴⁵⁰ See Appendix A, Final Rules, § 25.271(d). Operators have flexibility to adopt security strategies, including encryption and other measures, to ensure that their system is secure.

⁴⁵¹ Section 5.107 of the Commission's rules requires, in part, that each experimental licensee "shall be responsible for maintaining control of the transmitter authorized under its station authorization, including the ability to terminate transmissions should interference occur[.]" and that for conventional experimental radio stations the licensee "shall ensure that transmissions are in conformance with the operating characteristics prescribed in the station authorization and that the station is operated only by persons duly authorized by the licensee." 47 CFR § 5.107.

⁴⁵² Section 97.5 of the Commission's rules requires, in part, that amateur station apparatus "must be under the physical control of a person named in an amateur station license grant on the [Universal Licensing System] consolidated license database or a person authorized . . . by § 97.107 . . . before the station may transmit on any amateur service frequency from any place that is . . . [w]ithin 50 km of the Earth's surface and at a place where the amateur service is regulated by the FCC[.] . . . or [m]ore than 50 km above the Earth's surface aboard any craft that is documented or registered in the United States." 47 CFR § 97.5. Section 97.109 of the Commission's rules also addresses station control, including provisions for remote control of stations, 47 CFR § 97.109. Specific to space stations, section 97.207(b) states that "[a] space station must be capable of effecting a cessation of transmissions by telecommand whenever such cessation is ordered by the FCC[.]" 47 CFR § 97.207(b), and section 97.211(b) states that a space telecommand station may transmit special codes intended to obscure the meaning of telecommand messages to the station in space operation[.] 47 CFR § 97.211(b).

⁴⁵³ For example, Global NewSpace Operators point out the satellite industry statement on cybersecurity jointly prepared by SIA and the Global VSAT forum, which broadly encourages industry participants to adopt industry and government cybersecurity best practices. Global NewSpace Operators Comments at 18 (citing SIA and Global VSAT Forum, *Joint Statement on the Satellite Industry's Commitment to Cybersecurity*, Nov. 2016, <https://www.sia.org/wp-content/uploads/2016/11/SIA-GVF-Joint-Cybersecurity-Policy-Statement-FINAL-v.1-Nov-2016.pdf>).

⁴⁵⁴ See Clancy and Black Comments at 1-2 (suggesting a standing government working group charged with compiling a risk-based management framework for satellite cybersecurity); see also Maxar Comments at 14 (suggesting that the Commission should work with other federal agencies and industry stakeholders to ensure that any encryption requirements are technologically neutral); University Small-Satellite Researchers Reply at 14-15 (suggesting that instead of enacting TT&C encryption requirements at this time, the Commission could focus on encouraging best practices for satellite cybersecurity, and eventually consider conditioning authorizations on operators following cybersecurity best practices).

⁴⁵⁵ Eutelsat argues that the Commission should modify provisions in rules on confidentiality to provide additional protection for information concerning telecommand frequencies. Eutelsat Comments at 8-9. The relevant rules are contained in part 0 of the Commission's rules and are beyond the scope of this proceeding.

J. Frequency Coordination for Orbit-Raising

128. The Commission considered in the *Notice* whether to modify its rule requiring authority for telemetry, tracking, and command functions to raise the satellite to its normal orbit following launch. Specifically, the rule limited such operations to a non-harmful interference, unprotected basis, and addressed only GSO operations. The rule made it clear that orbit-raising types of maneuvers in the pre-operational phase for GSO satellites are authorized operations, even though they may vary from the orbital parameters specified in the license. The Commission proposed to modify the rule such that satellite telemetry, tracking, and command communications for orbit raising must be coordinated between satellite operators for both GSO and NGSO satellites, rather than require those operations to be performed on a non-interference basis.⁴⁵⁶ The Commission also proposed to extend the rule generally to NGSO satellites, so that orbit-raising maneuvers in the pre-operational phase for NGSO satellites would be considered authorized operations, even though they may vary from the orbital parameters specified in the license.⁴⁵⁷ We address each of these proposals in turn.

129. *Coordination Among Operators of Frequency Use During Orbit Raising.* Most commenters agreed with the Commission revising its rules so that telemetry, tracking, and command operations would be entitled to interference protection if coordinated with potentially affected satellite networks.⁴⁵⁸ Some commenters asked for clarification, or minor modifications, such as requiring informal, rather than formal coordination between operators.⁴⁵⁹

130. Under existing procedures, an operator is not strictly required to coordinate, but could simply accept interference from other operators. We find that this is not an ideal regime for telemetry, tracking, and command operations, and take this opportunity to clarify that operators should coordinate these operations to ensure that such operations are not subject to interference that could impact those critical communications links and affect physical space station operations.⁴⁶⁰ This rule change is appropriate as part of this proceeding because it implicates communications related to the physical location of the space station.⁴⁶¹ This coordination should also ensure that satellites already in service are not subject to interference from satellites engaged in orbit-raising.⁴⁶² We further clarify that the “coordination” specified in the revised rule is informal operator-to-operator coordination, rather than, for example, the formal procedures specified in the ITU regulations. Eutelsat points out that current practices involves discussion between operators to facilitate operations on a non-interference basis.⁴⁶³ Sirius XM states that we should not modify this rule with respect to GSO operators, because operators have

⁴⁵⁶ *Notice*, 33 FCC Rcd at 11376, para. 71.

⁴⁵⁷ *Id.* at para. 70.

⁴⁵⁸ *See, e.g.*, Boeing Comments at 36; Boeing Reply at 41; SES/O3b Reply at 5; ORBCOMM Comments at 9; Intelsat Comments at 4-5.

⁴⁵⁹ *See, e.g.*, Viasat Comments at 7; Eutelsat Reply at 2; SES/O3b Reply at 5; Sirius XM Reply at 2.

⁴⁶⁰ We understand this is the current practice in many instances, and take the opportunity to clarify the Commission’s rules. *See, e.g.* Lockheed Martin Comments at 16 (stating that coordination is effectively what would happen in most situations anyway); Viasat Comments at 7-8 (same).

⁴⁶¹ *See* Global NewSpace Operators Comments at 17-18 (stating that the Commission should clarify the intent of this rule change as it relates to mitigating orbital debris).

⁴⁶² *See* SiriusXM Comments at 7. Boeing requests that we revise the language of section 25.282 to state that both in-service satellites and those engaged in orbit-raising must be operated on a co-equal basis following the completion of a sufficient coordination process to ensure that unacceptable interference does not result to either party. Boeing Reply at 41-42. We find that this level of specificity is overly complex and would potentially create an unnecessary new status in the frequency bands typically used for these operations—and therefore conclude that a general clarification that such operations should be coordinated is sufficient for purposes of this rule.

⁴⁶³ Eutelsat Reply at 2.

conducted orbit raising for GSO satellites on a non-harmful-interference, unprotected basis for decades without issue.⁴⁶⁴ That may be the case, but we see no downside to clarifying that operators should be coordinating such operations. Sirius XM seems concerned that it would need to accept interference from satellites undertaking these operations,⁴⁶⁵ but that is not the case—we are simply ensuring that such operations are coordinated between operators, which appears largely to be a continuation of existing practices. We expect that the practice of coordination between operators will continue and the goal of our rule revision is to encourage such discussions, rather than requiring that the operator conducting orbit-raising activities operate on a non-interference basis.⁴⁶⁶ We decline to specify any particular requirements for the coordination process,⁴⁶⁷ other than that operators undertake coordination in good faith, with the goal of facilitating orbit-raising operations and ensuring the availability of the telemetry, tracking, and command links, while not unduly disrupting other ongoing operations.

131. A few commenters raise other issues. Global NewSpace Operators suggests that the Commission consider the unique aspects of NGSO orbit raising, including that it is much faster and that a specific radiofrequency interference event may occur without impacting operations due to the short duration.⁴⁶⁸ Regardless of the possibly short duration of a potential interference event, when it comes to frequency use for NGSO orbit raising, we maintain that it is in the public interest for space stations operators to coordinate those operations, even if the result is an agreed-upon short period of interference. Lockheed Martin supports the proposed change, but suggests an exemption for non-Earth orbit missions. The rule, as modified here, will continue to refer to “short-term, transitory maneuvers.”⁴⁶⁹ Rather than carve-out an exemption for non-Earth orbiting missions, we simply note that frequency use associated with longer-term transitory maneuvers can be addressed on a case-by-case basis, including as part of the space station authorizing conditions.

132. CSSMA comments specifically regarding systems operating in the Earth-Exploration Satellite Service, Meteorological-Satellite Service, and Space Operations Service, and states that since those operations are generally on a non-exclusive basis, CSSMA does not believe regulated radiofrequency coordination requirements are necessary in those bands.⁴⁷⁰ We would not characterize our rule clarification here as “regulated radiofrequency coordination requirements,” but simply a change that would ensure coordination specifically is completed to the extent necessary for telemetry, tracking, and command operations to be reliable and not impact other existing operations. If use of a particular frequency band is already shared through geographic separation of earth stations, for example, and the communications used for orbit-raising would be within the scope of that established sharing, then the operations would be considered “coordinated” and the operator would not need to undertake any additional coordination activities. There could be situations, however, where orbit-raising communications might be outside the scope of the established sharing regime for regular operations, and those orbit-raising communications would be coordinated. Thus, we decline to establish a carve-out for frequency bands that are used on a non-exclusive basis.

133. Intelsat asks that the rule be expanded to cover all orbit-raising operations, including Earth-to-space launch and early orbit phase (LEOP) operations conducted by earth stations, which are

⁴⁶⁴ Sirius XM Comments at 7.

⁴⁶⁵ See Sirius XM Comments at 7.

⁴⁶⁶ Our clarification that only informal coordination is required should address the concerns of Sirius XM as well about revisions to this rule. See Sirius XM Reply at 2-3.

⁴⁶⁷ Eutelsat asks us, for example, to provide guidance on any specific requirements contemplated in the context of operator-to-operator discussions. Eutelsat Comments at 6; Eutelsat Reply at 2.

⁴⁶⁸ Global NewSpace Operators Comments at 18.

⁴⁶⁹ See Appendix A, Final Rules.

⁴⁷⁰ CSSMA Comments at 18-19.

currently authorized pursuant to special temporary authority.⁴⁷¹ Since these radio frequency operations are authorized pursuant to special temporary authority, we declined to carve out an exception for earth station LEOP operations. We may revisit this issue in the future, however.

134. *Inclusion of Communications for Orbit-Raising in Authorization for NGSOs.* Although most commenters who address this issue agree with the proposal to extend authority to transmit to NGSO space stations during orbit-raising as part of a grant, without additional specific approval,⁴⁷² upon further consideration we decline to adopt this proposal. Instead we will continue the existing case-by-case practice of addressing these operations as part of the initial grant or through a license modification or special temporary authority. The change that the rule revision would have made would be to include such authority automatically in the original grant as we do for GSOs. After further consideration, we conclude that the explicit authorization process gives us the ability to examine the individual facts more closely, given the diversity of the types of operations present for NGSO orbit-raising. For NGSO satellites there is a broad range of potential operations that could be characterized as transmissions in connection with short-term, transitory maneuvers directly related to post-launch, orbit-raising maneuvers, and we conclude that it is in the public interest for those types of operations to be explicitly authorized, rather than automatically included in the grant. This will give other operators more information regarding the nature of such operations and facilitate coordination between operators as well as coordination with government operations in frequency bands shared with Federal operations. For the same reasons, we decline to extend the rule to operators supporting orbit-raising of MEO spacecraft at the end of the satellite's mission, as requested by SES/O3b.⁴⁷³

K. Liability Issues and Economic Incentives

1. Indemnification

135. In the *Notice*, the Commission sought comment on whether Commission space station licensees should indemnify the United States against any costs associated with a claim brought against the United States related to the authorized facilities under international law, specifically the Outer Space Treaties.⁴⁷⁴ Almost all commenters addressing the proposed indemnification requirement raised concerns, and several argued the proposal should be examined further before it is adopted.⁴⁷⁵ We conclude that further development of the record on this topic is warranted and we address this topic in the Further Notice below.⁴⁷⁶

⁴⁷¹ Intelsat Comments at 5.

⁴⁷² See, e.g., Intelsat Comments at 4; SES/O3b Reply at 5.

⁴⁷³ See SES/O3b Comments at 4; SES/O3b Reply at 6.

⁴⁷⁴ *Notice*, 33 FCC Rcd at 11378, para. 78. As discussed in further detail below, the United States is party to two international treaties addressing liability arising from activities in outer space—the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies (Outer Space Treaty) and the Convention on International Liability for Damage Caused by a Space Object (Liability Convention).

⁴⁷⁵ See, e.g., SIA Comments at 8-10, AT&T Comments at 6; Boeing Comments at v, 37-38; CSSMA Comments at 20; EchoStar/Hughes Comments at 7; Intelsat Comments at 12-15; LeoSat Comments at 9; Lockheed Martin Comments at 18-19; ORBCOMM Comments at 19; Sirius XM Comments at 9; Space Logistics Comments at 3, 13; Spaceflight Comments at 6; Telesat Comments at 11; ORBCOMM Reply at 3. Notably, one commenter, LeoSat, states that it “generally supports” the Commission’s objective in this area, but states that it needs more information regarding the Commission’s approach to indemnification agreements before LeoSat takes a firm position. LeoSat Comments at 9.

⁴⁷⁶ In *ex parte* filings, several parties requested that we further develop the record on this topic. See, e.g., SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 2-3; Letter from Jennifer A. Manner, Senior Vice President, Regulatory Affairs, (continued....)

2. Other Economic Incentives

136. *Insurance.* Separate from an indemnification requirement, the Commission had sought comment on the utility of insurance on its own as a means to incentivize operators to adhere to best practices in space.⁴⁷⁷ Specifically, the ability to obtain lower insurance premiums could provide an economic incentive for operators to adopt debris mitigation strategies that reduce risk. A number of commenters suggest that insurance generally would not necessarily incentivize good behavior in space, and provide information concerning the functioning of insurance markets that suggest they do not by themselves provide adequate incentives for debris mitigation.⁴⁷⁸ Given some of the limitations of insurance, we decline to adopt an insurance requirement on its own as a way of incentivizing “good behavior” in space. However, we seek comment in the Further Notice on whether a rule regarding indemnification will help to ensure that liability is considered as operators make decisions concerning satellite design and operation.⁴⁷⁹

137. *Other Incentives.* In the Further Notice below, we propose a performance bond for satellite disposal, which we tentatively believe would be in the public interest as an economic incentive. We decline, however, to adopt several of the other economic incentives proposed by commenters as ways to encourage best practices in orbital debris mitigation for Commission-authorized satellites and systems. None of the additional proposals have been developed sufficiently to demonstrate how they could be applied to the orbital debris mitigation context at this time.⁴⁸⁰ We do not discount these possibilities altogether, however, and may revisit other economic incentives at some point in the future.

138. NYU and Duke Science Regulatory Lab, for example, recommend that the FCC carefully consider employing “market-based processes” that “harness the efficiencies of the market to achieve policy objectives” by exploring the use of government created rights—commonly referred to as “marketable permits.” Examples of such marketable permits may include: “a cap and trade” system, auctioned launch permits, a “credit trading system,⁴⁸¹” and a “priority review voucher.”⁴⁸² Such marketable permits could create a limited right to place a designated mass object into orbit during a specific time frame and, as such, may be used to deter and mitigate orbital debris. As noted by various

(Continued from previous page) _____

EchoStar Satellite Services, L.L.C. and Hughes Network Systems, LLC to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, Attach. at 1 (filed Apr. 10, 2020) (EchoStar/Hughes Apr. 10, 2020 *Ex Parte*).

⁴⁷⁷ *Notice*, 33 FCC Rcd at para. 11379, para. 79.

⁴⁷⁸ *See, e.g.*, Boeing Comments at 37-38; Sirius XM Comments at 10; Secure World Foundation Comments at 11; NewSpace Operators Comments at 19; CSSMA Comments at 21-22; CSSMA Reply at 19. CSSMA cites to Secure World Foundation paper on the topic of whether insurance can help incentivize the responsible use of space. *Id.* (citing Victoria A. Samson, et. al., *Can the Space Insurance Industry Help Incentivize the Responsible Use of Space?*, 69th Annual Astronautical Congress (October 2018), available at http://swfound.org/media/206275/iac-2018_manuscript_e342.pdf). We refer to the views of the Secure World Foundation expressed on this topic in the record for this proceeding. *See* Secure World Foundation Comments at 8.

⁴⁷⁹ If insurance does become viable in the future as a means to incentivize orbital debris mitigation strategies through premiums, Global NewSpace Operators states that a space sustainability rating could be valuable to insurers as a market standard to assess risks posed by the operator to the orbital environment. Global NewSpace Operators Comments at 20; *see also* D-Orbit Comments at 4 (suggesting some means of recognition that will incentivize best practices). As indicated earlier in the Order, we intend to follow these developments closely.

⁴⁸⁰ *See also* Secure World Foundation Comments at 8 (stating its view that there are limits to the role that economic incentives can play in dealing with orbital debris challenges—and stating that the largest source of future debris is likely to be collisions between large spent rocket stages from government launches in decades past).

⁴⁸¹ NYU Reply at 10-11.

⁴⁸² Duke Science Regulatory Lab Comments at 20-24. *See also* D-Orbit Comments at 4 (proposing an “Ecotax” payable for every launch or for every year of satellite operations).

commenters, however, establishing any such marketable permit would be a substantial undertaking, given the complexities of defining, for example, an appropriate and tradeable “unit of exchange” or a quantifiable and verifiable monitoring process. Additionally, it is not clear how this type of system would fit within the Commission’s satellite licensing structure.

139. NYU suggests the use of a regulatory fee to deter and mitigate orbital debris.⁴⁸³ Such a regulatory fee, however, would require calibrating the dollar value of orbital debris; determining the amount of revenue that is required to achieve some orbital debris target, e.g., the projected cost for removal, mitigation or better design to minimize debris; and then deciding how to allocate fees across these differing objectives. The Commission also has limitations on its authority under the Communications Act to impose new regulatory fees—and indeed, we may not take into account risks of orbital debris creation under existing law.⁴⁸⁴ These issues are compounded further by the fact that satellite operators are not homogenous and include large global satellite operators as well as smaller regional operators that supply services to distinct geographic regions thereby affecting differently scale economies and the intensity of competition. Accordingly, we do not adopt these models for reducing or mitigating orbital debris.

L. Scope of Rules

1. Amateur and Experimental Operations

140. The Commission proposed in the *Notice* to amend the rules governing experimental satellite and amateur satellite authorizations to maintain consistency with the proposed revisions to the orbital debris mitigation rules for commercial systems.⁴⁸⁵ These authorized satellites have long been subject to orbital debris mitigation rules—as the Commission concluded in 2004 that it was in the public interest to require a description of the design and operational strategies used to mitigate orbital debris from applicants seeking to conduct experimental or amateur satellite operations.⁴⁸⁶ In the *Notice*, the Commission stated that it continues to believe that it is appropriate for amateur licensees and experimental applicants to provide a similar amount of disclosure regarding debris mitigation plans as will be required of commercial satellites, and sought comment.⁴⁸⁷ A number of commenters agreed that the amateur and experimental operations should be subject to the same orbital debris mitigation rules as commercial operations.⁴⁸⁸ Commenters with interest in amateur operations generally request that we carefully consider the impact of any proposed regulations on amateur satellite organizations and others building and operating space stations in the amateur satellite service.⁴⁸⁹

⁴⁸³ NYU Reply at 13-14.

⁴⁸⁴ See 47 U.S.C. § 159.

⁴⁸⁵ *Notice*, 33 FCC Rcd at 11380, para. 82. The Commission noted that although it used the term “commercial” generally to refer to operations under part 25 of the Commission’s rules, there is no requirement in part 25 that operations authorized under that part must be for an inherently commercial purpose. *Id.* at n.184.

⁴⁸⁶ *2004 Orbital Debris Order*, 19 FCC Rcd at 11607-09, paras. 98-101, Appendix B. In the Order on Reconsideration issued by the Commission along with the *Notice* in this proceeding, the Commission denied a petition for reconsideration of the Commission’s 2004 rules, in IB Docket No. 02-54, reiterating that it was in the public interest to apply orbital debris requirements to amateur radio service satellite operators. See *Mitigation of Orbital Debris in the New Space Age; Mitigation of Orbital Debris*, Notice of Proposed Rulemaking and Order on Reconsideration, 33 FCC Rcd at 11386-91, paras. 101-113 (2018).

⁴⁸⁷ *Notice*, 33 FCC Rcd at 11380, para. 82.

⁴⁸⁸ See NASA Comments at 7; Telesat Comments at 11; CSSMA Comments at 23; ORBCOMM Comments at 9; Global NewSpace Operators Comments at 20.

⁴⁸⁹ AMSAT Reply at 3.

141. In most instances, the issues relevant to amateur and experimental operations are discussed above in the context of specific rule changes.⁴⁹⁰ We address a few additional issues below. As a general matter, the Secure World Foundation asks us to clarify the intent and actual impact of the proposed rule changes on the experimental and amateur satellite communities.⁴⁹¹ As part of our analysis on the specific rule changes above, we have taken into consideration any comments filed by parties with an interest in amateur satellites, or experimental satellite licensing, such as AMSAT and the University Small-Satellite Researchers. Where concerns have been raised about the application of rules to satellites and systems authorized under the experimental and amateur authorization processes, we have addressed those concerns. We note that, absent exceptions as noted in the discussion above, we will generally apply the same orbital debris mitigation rules to experimental and amateur-authorized stations because we conclude that these space stations can also pose risks to the on-orbit environment and to humans on the surface of the Earth, and so it is in the public interest to apply the same orbital debris requirements to satellites regardless of the type of authorization. We recognize as a general matter that amateur and experimental satellite operators may incur costs as a result of the revised orbital debris mitigation practices we adopt in this Order. However, given the potentially significant risks associated with any space station, we believe these costs are outweighed by the benefits of having orbital debris mitigation rules that are generally-applicable to non-government satellites, and that do not favor one type of system over another based solely on whether the application is filed under part 5, part 25, or part 97.

142. Global NewSpace Operators suggests that an applicant should only be required to submit a collision analysis if it has the resources to do so, suggesting that some amateur or experimental space station operators may not.⁴⁹² Since compliance can be demonstrated through use of the NASA Debris Assessment Software, which is available at no-cost, and has been used by many experimental applicants and amateur space station operators, we do not see an issue with applying this requirement to those types of space stations.

143. We also recognize that in some instances, space stations, particularly amateur and experimental stations, are co-located on spacecraft with other space stations. AMSAT requests that we consider certain exemptions from orbital debris requirements in this scenario.⁴⁹³ In instances where there are multiple space stations co-located on the same spacecraft, and information on orbital debris mitigation plans has been provided or will be provided by one or more of the space station applicants in conformance with the Commission's rules, applicants for other co-located space stations may satisfy the disclosure requirements through incorporation by reference.⁴⁹⁴ In other words, there is no need for space station applicants to submit multiple copies of the same documentation to the Commission.⁴⁹⁵ We decline to adopt a blanket exemption from orbital debris disclosures for space stations co-located with U.S. government space stations, but suggest that applicants for such space stations could seek a waiver of our

⁴⁹⁰ For example, we discuss the applicability of rules related to the sharing of ephemeris data to amateur and experimental satellites. *See* SES/O3b Reply at 6-7. As another example, in the Further Notice we address the application of an indemnification requirement to amateur and experimental satellite operators. *See, e.g.*, CSSMA Comments at 23.

⁴⁹¹ Secure World Foundation Comments at 9.

⁴⁹² Global NewSpace Operators Comments at 6.

⁴⁹³ AMSAT Comments at 8. ARRL also supports this proposal. *See* ARRL Comments at 2.

⁴⁹⁴ Although AMSAT requests that we adopt language related specifically to the operations of amateur space stations authorized under Part 97, we see no reason not to extend this discussion to space stations authorized under Parts 5 and 25 as well.

⁴⁹⁵ This would only apply where the orbital debris mitigation information submitted for one space station would cover the orbital debris mitigation requirements associated for the other space station. It would not apply, for example, where a space station is only temporarily located on another spacecraft. *See* CSSMA Reply at 3 (cautioning that any exemptions should not apply to satellites temporarily co-located on deployment vehicles).

orbital debris mitigation disclosure requirements on the basis that the plans are being evaluated by another U.S. government entity. In such instances, the Commission would request that the FCC applicant or operator specify the U.S. government agency and contact for officials who would be responsible for the orbital debris mitigation component of the spacecraft operations. This should be a relatively straightforward process in many cases—for example, there is no reason for the Commission to independently evaluate the orbital debris mitigation plan for an experimental space station planned to be co-located on the ISS. Applicants and operators should be aware however, that additional information may be necessary in certain factual scenarios—such as where the governmental space station operations will conclude before the Commission-authorized operations.⁴⁹⁶

2. Non-U.S.-Licensed Satellites

144. The Commission also proposed in the *Notice* that the new and amended rules adopted should be applicable to non-U.S.-licensed satellites seeking access to the U.S. market.⁴⁹⁷ This approach is consistent with the Commission’s current rules.⁴⁹⁸ A number of commenters support the Commission’s proposal to continue applying orbital debris mitigation requirements to non-U.S. licensed satellites seeking authority to access the U.S. market, and some commenters also support the existing approach of allowing non-U.S.-licensed satellite operators seeking U.S. market access to satisfy orbital debris mitigation requirements by demonstrating that their orbital debris mitigation efforts are subject to direct and effective regulatory oversight by another national licensing authority.⁴⁹⁹ CSSMA suggests that operators be permitted to demonstrate that their system’s orbital debris mitigation plans are subject to direct and effective regulatory oversight by their foreign national licensing administration in cases where the operator does not have a substantial U.S. commercial presence, but is using U.S.-based activities for telemetry, tracking, and command.⁵⁰⁰ Global NewSpace Operators, on the other hand, states that the degree of activity should not be a factor and that transmission and reception on a limited basis, such as telemetry, tracking, and command, still constitutes a commercial activity and those operators should be held to the same rules as a U.S.-licensed operator.⁵⁰¹ We agree with Global NewSpace Operators, and we do not think it is useful to make degree of activity the deciding factor for how to assess an applicant’s orbital debris mitigation plans.

145. Regarding orbital debris mitigation plans specifically, the Commission previously concluded that the disclosure requirements could be satisfied by showing that the satellite system’s debris mitigation plans are subject to the direct and effective oversight by a non-U.S.-satellite system’s national licensing authority—which could include submitting an English language version of the debris mitigation rules or regulations of the authority and indicating the current status of the national licensing authority’s review.⁵⁰² SpaceX asks that we extend this treatment to systems authorized by countries only with truly

⁴⁹⁶ One example is the FalconSAT-3 spacecraft, which was made available for amateur radio service operations following conclusion of operations using NTIA-authorized frequencies. *See, e.g.*, U.S. Air Force Academy, “Astronautics Department to Retire ‘Workhorse’ Satellite,” April 24, 2017, available at <https://www.usafa.edu/news/astronautics-department-retire-workhorse-satellite/>.

⁴⁹⁷ *Notice*, 33 FCC Rcd at 11381, para. 85.

⁴⁹⁸ *See* 47 CFR § 25.137(b) (requiring legal and technical information for the non-U.S.-licensed space station of the kind that § 25.114 would require in a license application for a space station).

⁴⁹⁹ *See, e.g.*, Viasat Comments at 2; Keplerian Tech Comments at 17; Secure World Foundation Comments at 9; Global NewSpace Operators Comments at 20; Eutelsat Comments at 12-13; CSSMA Comments at 23; OneWeb Comments at 32-34; OneWeb Reply at 1-2. CSSMA also notes its support for the Commission requiring information pertaining to the inclusion of applicants’ systems in the United Nations Register of Objects Launched into Outer Space. CSSMA Comments at 23.

⁵⁰⁰ CSSMA Comments at 24.

⁵⁰¹ Global NewSpace Operators Comments at 20.

⁵⁰² 2004 *Orbital Debris Order*, 19 FCC Rcd at 11606, para. 95.

equivalent approaches to safe space.⁵⁰³ We decline to set the exact parameters here for what constitutes “direct and effective oversight” in every instance, since foreign administrations may have different approaches which ultimately achieve the same result. We note, however, that transparency of the other administration’s process is an important part of this assessment, particularly since the Commission’s rules include a number of disclosures that are meant to inform not only the Commission, but also other operators so that those operators can plan accordingly.

M. Other Issues

1. Lunar/Other Orbits

146. Several commenters suggested that we adopt rules relating to the protection of lunar and other orbits.⁵⁰⁴ We believe that regulations specific to lunar and other orbits is premature, and decline to establish any such rules at this time, particularly as they relate to satellite disposal. Operators will be required, however, to provide information in applications concerning limiting release of debris, limiting explosion risk, safe flight profiles, and plans for post-mission disposal, if any.

2. Implementation of the New Rules

147. Several commenters suggest that it is not practical to apply new debris mitigation requirements retroactively to operators already in-orbit.⁵⁰⁵ CSSMA, for example, asks that we take into account that any changes to existing rules must be phased in over a period of several years so that the U.S. industry has time to evolve its technology and business plans.⁵⁰⁶ We observe that most of the rules adopted in this proceeding are application rules. Except where otherwise specified in this Order, the rules will apply to new applicants and not retroactively to existing applicants.

148. In some specific instances, applications have been granted in part on the condition that the applicant file a modification application for Commission review including updated information on their orbital debris mitigation plan. These modification applications must provide information that satisfies the new rules that we adopt as part of this proceeding. Additionally, any other modifications filed by existing licensees or grantees seeking to modify their authorization as it relates to the orbital debris mitigation plan will be subject to rules adopted in this proceeding.

149. There is also one change to an operational rule regarding orbit-raising coordination. We do not anticipate that this will present any concerns to existing operators from a compliance perspective, since the record suggests that many operators already coordinate orbit-raising activities with other potentially affected operators. Therefore, we require operators to comply beginning on the effective date of the rule, or if compliance is not possible, seek waiver of the rule.

N. Additional Topics from the Regulatory Impact Analysis

150. In the *Notice*, as part of the Regulatory Impact Analysis, the Commission considered and sought comment on various regulatory alternatives to reducing debris in orbit.⁵⁰⁷ Some of these approaches were related to other specific proposals in the *Notice* (e.g., changes in operations and disposal

⁵⁰³ SpaceX Reply at 8; *see also* EchoStar/Hughes Comments at 7-8.

⁵⁰⁴ *See* CSSMA Comments at 4; Xplore Comments. CSSMA, for example, states that new rules should be developed for operations around other celestial bodies as needed, and that rules applicable to Earth-orbiting spacecraft should apply to these spacecraft when they are in Earth orbit after launch and on the way to deep space. *See also* Lockheed Martin Comments at 7 (stating that it is not clear how the term “operational orbit” would apply to future commercial space missions that are not Earth-centric or that are in Earth orbit for just a short time before leaving for other mission objectives).

⁵⁰⁵ *See, e.g.*, Global NewSpace Operators Comments at 23; CSSMA Reply at 20-21.

⁵⁰⁶ *Id.*

⁵⁰⁷ *Notice*, 33 FCC Red at 11382-11386, paras. 88-100.

procedures). Other alternatives (e.g., fewer launches) were different from the proposals that the Commission otherwise proposed in the *Notice*. The Commission sought comment on six regulatory alternatives to address orbital debris: fewer launches, changes in satellite design, changes in operations and disposal procedures, use of economic incentives, active collision avoidance, and active debris cleanup. The majority of these involve some type of regulatory activity. Based on the record and as discussed below, we conclude that as a general matter, operators would not necessarily be incentivized on their own to take action that is beneficial for the prevention and reduction of orbital debris in orbit absent regulatory action.

151. As an introduction to the Regulatory Impact Analysis, the Commission provided some high-level analysis on the benefits of mitigating orbital debris, and how debris can be characterized as a negative externality. That is, that while the debris problem is a significant consideration for the joint use of orbital resources, such considerations may not play a sufficient role in economic decision-making by operators individually. Reductions in the amount of debris created can help preserve orbital resources over the long-term. The costs and benefits are difficult to quantify—but in a worst-case scenario, certain valuable orbits could become useable only at an extremely high cost, rendering them unusable for most operators.⁵⁰⁸ If there were large concentrations of debris in LEO, for example, certain areas could not be used to provide any satellite service. The same holds true for GEO, a particularly valuable orbit for satellite communications. These would be significant costs for the satellite industry overall, and may end up in the discontinuation of certain types of commercial satellites or systems, not to mention the potential impact on costs for U.S. government systems.⁵⁰⁹ Moreover, there is a tendency of debris to generate yet more debris through collisions—resulting in an escalating debris situation, even if no new debris is added as a result of ongoing operations.⁵¹⁰ On the other hand, there are costs associated with practices such as collision avoidance and disposal—which we discuss in the context of each section above.

152. Additionally, there are considerations of how any U.S. regulations, specifically FCC regulations, can benefit the overall orbital debris environment, since the United States is only one among many spacefaring nations. Given the common pool nature of space, as previously explained, one country's decision to improve the efficiency with which space is used will convey a benefit to other countries that employ space even if that country does not employ such measures. That only the satellite operators of the country employing the measures designed to limit orbital debris are incurring the associated costs while the benefits are enjoyed by everyone, likely will create incentives for other countries to “free-ride” off of the efforts of the providers licensed by efficiency enhancing countries. In the *Notice* the Commission reiterated the Commission's 2004 statement that: “we do not believe that the theoretical possibility that other countries could take ill-considered actions, at variance with international norms, in any way should prevent the Commission from adopting objective and transparent measures concerning orbital debris mitigation that serve the public interest.”⁵¹¹ Furthermore, as discussed above, we will apply the same orbital debris mitigation rules to non-U.S.-licensed satellites and systems seeking market access as we apply to U.S.-licensed systems, so that both types of satellites and systems will be subject to the same orbital debris regulation.

153. Some of the commenters in this proceeding responded to specific aspects of the Regulatory Impact Analysis, and in particular, disagreed with the options of limiting launches and

⁵⁰⁸ With increasing amounts of debris, operation in certain orbits becomes possible only through use of fuel resources for collision avoidance and increasing shielding, both of which can be significant expenses. Once costs become high enough, operators may decide to abandon operations in certain areas of space, even if operating in that area of space would generally be beneficial.

⁵⁰⁹ If the government was able to continue operating its assets in areas of space crowded with debris, it would be only at a significant cost.

⁵¹⁰ See *Notice*, 33 FCC Rcd at 11383, para. 89-90.

⁵¹¹ *Notice*, 33 FCC Rcd at 11383, para. 90 (quoting *2004 Orbital Debris Order*, 19 FCC Rcd at 11607, para. 97).

regulating how satellites or satellite systems are designed.⁵¹² For example, Eutelsat states, from the perspective of a GSO operator, that regulation of spacecraft design could inhibit innovation and competition by manufacturers regarding ways to limit orbital debris, improve satellite operations, and ensure reliable end-of-life operations.⁵¹³ Eutelsat further states that it may be difficult to identify a meaningful list of design elements that should be limited by rule and frequently updated to reflect technological progress.⁵¹⁴ Astranis also disagrees with the Commission regulating how satellites or satellite systems are designed, stating that in the case of GSO satellites, market forces (including manufacturer and operator commercial objectives) and well-settled international requirements are sufficient to drive reliable design elements.⁵¹⁵ Global NewSpace Operators states that while the government has a role to play in incentivizing industry, it does not recommend mandating specific satellite design concepts or active collision avoidance,⁵¹⁶ rather preferring that these elements emerge as industry best practices.⁵¹⁷ The Secure World Foundation states that changes in satellite design, operations and disposal and procedures, and economic incentives should all be considered as part of strengthening orbital debris mitigation requirements, and that ensuring better post-mission disposal through design and procedures represents the best opportunity for reducing the future growth of the space debris population from new launches.⁵¹⁸ The Secure World Foundation also notes that even with strong post-mission disposal, active debris removal or just-in-time collision avoidance of existing large debris objects will be required to prevent the collisions that will generate thousands of new pieces of debris.⁵¹⁹ According to the Secure World Foundation and Global NewSpace Operators, it is difficult to determine what the exact right mix of these components will be, and suggests that the U.S. government consider funding more public research and analysis of the orbital debris problem and holistic approaches to addressing space sustainability.⁵²⁰ Many commenters also expressed views on the costs of certain rule revisions in the context of the discussion above, which we have considered as part of those analyses. Overall, we conclude that taking the action to adopt updates to our rules at this time balances the costs of requiring U.S. commercial and other non-governmental operators to address orbital debris mitigation as part of the current licensing process, with the benefit of limiting the increase in new debris in orbit.⁵²¹ At the same time, we recognize the need for continued research and development in this area,⁵²² and expect that given

⁵¹² See, e.g., Sirius XM Comments at 10-11; Boeing Comments at 39-40, Global NewSpace Operators Comments at 20-21. In addition to disagreeing with the approaches to limit launches and regulate satellite design, Boeing argues that the Commission should not require satellite operators to engage in active debris cleanup. Boeing Comments at 40.

⁵¹³ Eutelsat Reply at 7; see also Astranis Reply at 3-4 (agreeing with Eutelsat). As Eutelsat notes, the Commission does review satellite designs to some extent in the context of review of applications and market access petitions. *Id.*

⁵¹⁴ Eutelsat Reply at 7.

⁵¹⁵ Astranis Reply at 3-4.

⁵¹⁶ See also D-Orbit Comments at 5 (discussing active debris cleanup in the context of the Regulatory Impact Analysis).

⁵¹⁷ Global NewSpace Operators Comments at 21.

⁵¹⁸ Secure World Foundation Comments at 10.

⁵¹⁹ *Id.*

⁵²⁰ *Id.*; see Global NewSpace Operators comments at 21.

⁵²¹ As discussed above, the Commission has required orbital debris mitigation plans since 2004, and the updated rules build on the Commission's existing framework, taking into consideration practices that have been common among applicants, such as using the NASA Debris Assessment Software tool, thus promoting regulatory certainty.

⁵²² The Secure World Foundation suggests that the Commission identify an agency responsible for coordinating scientific research on improving fundamental knowledge of the space environment, advancing the science and technology of critical space situational awareness inputs, and developing new hardware and software to support data (continued....)

the pace of developments in the space industry and U.S. government, orbital debris regulation may become a more rapidly iterative process than it has been in the past. Given the record established both specific to the Regulatory Impact Analysis as well as specific to other topics in the proceeding, we agree with Global NewSpace Operators that the most practical, cost-neutral, and immediate regulatory actions can come from requiring changes in operations and disposal procedures.⁵²³

IV. FURTHER NOTICE OF PROPOSED RULEMAKING

A. Probability of Accidental Explosions

154. Our existing orbital debris rules require that applicants provide a statement that the space station operator has assessed and limited the probability of accidental explosions during and after the completion of mission operations. We had not proposed to change this rule as part of the *Notice*, but observe that the ODMSP now includes a metric for assessing this objective.⁵²⁴ The ODMSP states in relevant part that “[i]n developing the design of a spacecraft or upper stage, each program should demonstrate, via commonly accepted engineering and probability assessment methods, that the integrated probability of debris-generating explosions for all credible failure modes of each spacecraft . . . (excluding small particle impacts) is less than 0.001 (1 in 1,000) during deployment and mission operations.”⁵²⁵ We seek comment on inclusion of this metric in our rules. Specifically, we propose to modify our rule such that applicants must include in the orbital debris statement a demonstration concerning limiting risk from accidental explosions and associated orbital debris during mission operations, including the 0.001 threshold.⁵²⁶ We seek comment on how the Commission should assess such demonstrations, noting that the ODMSP states that the demonstration should be “via commonly accepted engineering and probability assessment methods.”⁵²⁷ We also seek comments on the costs and benefits of incorporating a specific metric on this topic into our application disclosure rules.

B. Total Probability of Collisions with Large Objects

155. In response to the *Notice*, we received a number of differing views regarding whether the Commission should consider collision risk with large objects on a system-wide, i.e., aggregate, basis, and if so, how.⁵²⁸ We believe these issues merit further discussion and expansion of the record on how the

(Continued from previous page) _____

processing and observations as outlined in SPD-3. Secure World Foundation Comments at 11. This recommendation goes beyond the scope of this proceeding.

⁵²³ See Global NewSpace Operators Comments at 21.

⁵²⁴ Boeing and SIA ask that we specify this value in our rules. See Boeing *Ex Parte* at 7-8 (citing ODMSP, 2-1); SIA *Ex Parte* Letter, Attach. at 4.

⁵²⁵ ODMSP, 2-1.

⁵²⁶ Boeing suggests that we consider whether this metric should be included in the rules. See Boeing Apr. 16, 2020 *Ex Parte* Letter at 3.

⁵²⁷ *Id.*

⁵²⁸ See, e.g., SpaceX Comments at 14-16; Telesat Comments at 3; LeoSat Comments at 3, Boeing Comments at 2; Amazon Reply at 2-3; Aerospace Comments at 7; ORBCOMM Comments at 7; OneWeb Comments at 16-17; Global NewSpace Operators Comments at 6; CSSMA Comments at 7-8. Janka, Chief Officer, Global Government Affairs & Regulatory, Viasat, Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 2-3 (filed April 15, 2020) (Viasat Apr. 15, 2020 *Ex Parte*).

Commission should analyze multi-satellite NGSO systems, and in particular, large constellations in this context. The NASA Standard, also incorporated into the revised ODMSP, provides that the probability of collision with large objects (10 cm or larger) not exceed 0.001 (1 in 1,000) during the orbital lifetime of a single satellite.⁵²⁹ With improved access to space, it is increasingly possible to launch constellations of satellites that number in the hundreds or thousands. For deployments of satellites in such numbers, analysis of whether individual satellites in the system satisfy the 0.001 (1 in 1,000) metric on a per-satellite basis, absent any additional analysis, might not adequately address the ultimate probability of collision. While we believe these concerns can in many cases be addressed through sufficiently reliable mitigation measures such as maneuverability and orbit selection, these types of concerns form the basis for seeking comment here on how the Commission should review the collision risks associated with multi-satellite systems from the perspective of sustaining the space environment while at the same time encouraging deployment of new and innovative satellite systems designed to provide beneficial services to the U.S. public.

156. The revised ODMSP includes a new objective titled “clarification and additional standard practices for certain classes of space operations.”⁵³⁰ This objective includes a discussion of “large constellations” and lists a number of factors to be considered when looking at various aspects of these large constellations.⁵³¹ In the context of a threshold for post-mission disposal reliability, the ODMSP guidance states that “factors such as mass, collision probability, orbital location, and other relevant parameters should be considered.”⁵³² As we consider the ODMSP to use as a reference in the commercial and otherwise non-governmental context,⁵³³ we seek comment on the role that this guidance should play in our rules, including how to analyze collision risk specifically when it comes to multi-satellite constellations.

157. First, we ask how the Commission should consider the collision risks associated with a system in its entirety as part of the licensing process. Is assessing the total probability of collision on a system-wide basis consistent with the public interest? Assuming that the Commission should consider collision risks on a system-wide basis as part of its licensing process, we seek comment on the process through which such collision risks should be considered.⁵³⁴ We seek comment on the factors that could be considered in performing an analysis, and if there are metrics or thresholds that can provide additional certainty to applicants regarding the Commission’s review process.⁵³⁵ For example, one possible approach could be to identify a system-wide collision probability metric or other metric that, if exceeded, would trigger further review. Such an approach could provide applicants with a clear safe harbor when designing their systems. For applicants exceeding the threshold, additional specific factors could be identified that the Commission would take into consideration as part of its further review. We seek comment on this approach, or whether there are other suitable indicators that might help to categorize some systems as lower-risk and some as requiring further analysis. Would this approach provide

⁵²⁹ ODMSP, 3-1; NASA Standard at 4.5.2. The NASA Standard applies this metric to “each spacecraft and launch vehicle orbital stage in or passing through LEO.” NASA Standard at 4.5.2.2.

⁵³⁰ ODMSP, Objective 5.

⁵³¹ The ODMSP specifies that “large constellations” are constellations consisting of 100 or more operational spacecraft. ODMSP, 5-1.

⁵³² ODMSP, 5-1.a.

⁵³³ As noted, by its terms, the ODMSP applies to U.S. government activities, but provides a reference generally to promote efficient and effective space safety practices. ODMSP, Preamble.

⁵³⁴ *See, e.g.*, Aerospace Comments at 7 (“An aggregate risk should be applied to large constellations, while individual risk should be applied to small systems.”).

⁵³⁵ To the extent possible, we ask that commenters supporting or disagreeing with particular metrics provide analysis that includes sample constellation sizes, satellite area-to-mass ratio, deployment altitudes, and other potentially relevant considerations.

adequate regulatory certainty or is a bright-line rule that applies in all cases preferable? How should we balance the certainty provided by a bright-line rule with the flexibility provided by a safe harbor approach?⁵³⁶

158. We seek comment on the factors that could be relevant both in establishing a threshold or bright-line rule, and in assessing a system on a more detailed basis, for example, if the system risk exceeds a particular safe harbor. We seek comment on consideration of factors including per-satellite collision risk, maneuverability, number of satellites (potentially including constellation replenishment rate and replacement satellites), orbital lifetime, and/or size for NGSO satellites. Are there any other factors that could or should be considered?⁵³⁷ We note that as adopted in the Order, the calculation of the per-satellite collision risk using the NASA Debris Assessment Software, or higher fidelity model would already take into account the initial orbit and area-to-mass ratio of an individual satellite.⁵³⁸ When assessing total collision risk, should we attempt to make a bright-line distinction between large constellations and small systems, with different applicable metrics, or should we attempt to specify a metric that is scalable to both small and large multi-satellite systems?⁵³⁹ We also seek comment on whether we should establish a separate process for evaluation of system-wide collision risk for satellites that operate in the MEO region.⁵⁴⁰

159. To the extent that we consider a particular threshold or safe harbor that would be applicable to multi-satellite NGSO systems, we seek comment on using total collision risk, i.e., in the aggregate, as calculated as the sum of the probability of collision associated with each individual satellite in the system. Should we ask that applicants take into consideration replacement/replenishment satellites as part of this calculation, and if so, over what period of time?⁵⁴¹ Is the 15 years that correlates with the

⁵³⁶ See SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 2 (expressing concern regarding a case-by-case analysis in this area); SpaceX Apr. 16, 2020 *Ex Parte* Letter at 2 (expressing similar concerns).

⁵³⁷ See, e.g., CSSMA Comments at 8 (stating that a constellation's "impact" or "consequence" should be calculated as a function of several factors including expected failure rate, cross-sectional area, mass, orbital altitude and special density, and orbital decay time).

⁵³⁸ See NASA Standard, 4.5.4.2.2. Using the NASA Debris Assessment Software, the weighted cross-sectional area flux for the orbital debris environment exposure is derived by evaluating the amount of time the spacecraft spends in different altitudes during its orbital lifetime. *Id.* This value is determined by the Debris Assessment Software given the initial orbit, area-to-mass ratio, and the launch date of the spacecraft. *Id.* If the spacecraft is maintained at a specific altitude during its mission and/or maneuvers to a different orbit for disposal at end of the mission, the probability of collision with large objects is evaluated separately for the different orbits and then summed. *Id.*

⁵³⁹ See, e.g., Aerospace Corp. Comments at 7 (recommending that a "large constellation" be explicitly defined based on a combination of numbers of satellites, and the total mass and area of the satellites). Telesat suggests that we "pro-rate" application of probability of collision metrics, such that a 0.001 metric should apply to those satellites with 5-year service life, but the 0.001 metric should be doubled when applied to those satellites with a 10-year service life, and halved when applied to those satellites with a 2.5 year service life. Telesat Comments at 3 & n.4. According to Telesat, this would incentivize deployment of satellites with longer missions, since replenishment of shorter-lived satellites can lead to increased risk of debris. *Id.* at 3.

⁵⁴⁰ We note that the ODMSP does not provide a separate metric for spacecraft operating in MEO for assessment of per-satellite probability of collision with large objects. See ODMSP, 3-1. The ODMSP does provide for a 100-year maximum orbital lifetime for use in the assessment, however, and as the *Order* specifies above, applicants planning to operate spacecraft in the MEO region can refer to this 100-year value in calculating probability of collision on a per-satellite basis. See also Aerospace Comments at 8 (limiting the period of assessing collision probability to a finite time such as 100 years will make assessment feasible for satellites that have an orbital lifetime greater than 100 years).

⁵⁴¹ We note that any provisions regarding replacement satellites would only apply to systems authorized under part 25, excluding satellites licensed under the streamlined process, since replacement satellites are not contemplated as part of either a part 5 experimental or part 97 amateur space station authorization, or as part of the streamlined small satellite processes. Under the Part 25 rule, technically identical replacement satellites can be deployed without any

(continued....)

typical licensing period for part 25 NGSO systems a reasonable period of time?⁵⁴² We observe that depending on the replenishment cycle of a constellation, the total number of satellites launched into orbit over the course of a license term could be significantly higher than the number of satellites authorized for operation at any given time.⁵⁴³ Are rapidly replenished satellites more likely to be deployed into lower orbits, however, where an individual satellite's collision risk would generally be lower?⁵⁴⁴ We seek comment on how the number of satellites could be calculated for purposes of analysis. In the *Notice*, we proposed to refer to the 0.001 probability of collision metric in assessing total collision probability as a whole. Some commenters agreed that total collision risk should be assessed, but disagreed about whether the 0.001 metric should apply. We seek comment on using a total collision probability metric as a threshold or safe harbor, and ask whether commenters may have different views on the application of a 0.001 probability of collision metric to the satellite constellation as a whole, if that metric was used only to identify those systems that would require additional review. In addition, is there a metric other than 0.001 that should be used as a threshold or safe harbor? We recognize that using a total collision risk metric would require that larger systems meet a lower per-satellite risk than smaller systems. Should the Commission consider another factor or factors entirely, such as number of satellites and mass?⁵⁴⁵

160. We also seek comment on whether, and to what extent, reliability or failure rate of any maneuvering capabilities should be part of the Commission's review of collision risk. The Order specifies that for individual satellites, the probability of collision with large objects may be deemed zero, absent evidence to the contrary, during any period where the satellite is capable of maneuvering to avoid collisions.⁵⁴⁶ With respect to multi-satellite systems, we expect that most systems will have some maneuvering capabilities. We ask how we should evaluate or otherwise consider the likelihood that any individual satellites in a multi-satellite system will experience a failure of those maneuvering capabilities. Should we accept applicant's targeted reliability at face value, absent any evidence emerging to the

(Continued from previous page) _____

limitation during a license term in order to maintain the authorized number of operational satellites. 47 CFR § 25.113(i).

⁵⁴² See 47 CFR § 25.121(a), (b). NGSO space stations are typically issued for a period of 15 years, although the Commission reserves the right to grant station licenses for less than 15 years. *Id.*

⁵⁴³ For example, a system of 100 satellites, fully replenished three times over the course of a 15-year license term would result in a total of 400 satellites launched. See SpaceX Apr. 16, 2020 *Ex Parte* Letter at 2 (suggesting that taking into consideration all satellites launched over a 15-year license term, including replacement satellites, would create incentives to freeze innovation over the life of the license and deter those who would otherwise deploy updated technology, including improvements in collision avoidance, over the course of a license term).

⁵⁴⁴ See, e.g., Space Exploration Holdings, LLC, IBFS File No. SAT-MOD-20181108-00083, Letter from William M. Wiltshire, Counsel to SpaceX, Harris, Wiltshire & Grannis LLP to Jose P. Albuquerque, Chief, Satellite Division, FCC at 2 (Mar. 13, 2019) (stating that even if all the 1,584 satellites it proposed for deployment at 550 km were immediately incapable of maneuvering upon orbital injection, remained in a stowed configuration, and were de-orbiting during a period of solar minimum, the aggregate probability of collision would be 0.00048, i.e., less than half of 0.001); see also *Space Exploration Holdings, LLC, Request for Modification of the Authorization for the SpaceX NGSO Satellite System*, Order and Authorization, DA 19-342, para. 22 (IB April 26, 2019).

⁵⁴⁵ See, e.g., CSSMA Comments at 8.

⁵⁴⁶ In discussing system-wide collision risk as part of an *ex parte* filing, SpaceX cites to NASA's comment that "[t]he calculation of on-orbit collision avoidance residual risk can be approached in different ways and requires a number of assumptions, each of which should sustain formal examination and testing before implementation in order to ensure their reasonableness." SpaceX Apr. 16, 2020 *Ex Parte* Letter at 3 (quoting NASA Comments at 2). We observe that this NASA comment relates to some of the complexities of collision avoidance residual risk, including situations in which the risk associated with a particular collision is below the risk threshold at which a particular operator would perform a collision avoidance maneuver. See *id.* As discussed in the Order, NASA's comments recommend adhering to a historical approach on this point for now, which can include presuming that a satellites' risk of collision is zero during an active mitigation period. *Id.* This is the approach we adopt in the Order.

contrary? Alternatively, are there methods for assessing proposed reliability rates or determining whether certain failure rates may raise concerns with collision risk? For purposes of developing a threshold or safe harbor, should the Commission ask applicants to assume a certain maneuverability failure rate when calculating total collision risk? An example of this would be if in processing applications, systems having a total collision probability of less than 0.001, calculated assuming a 10% failure of maneuvering capability,⁵⁴⁷ are considered low risk for total collision probability and thus deemed not to need any further analysis with respect to collision risk. We seek comment on this type of approach, whereby we consider an assumed failure rate value for purposes of a safe harbor, rather than the applicant's expected failure rate, since additional information may be required to support an expected maneuvering failure rate.⁵⁴⁸ We also seek comment on what might be a reasonable maneuverability failure rate for establishing a safe harbor, whether based upon an assumed reliability or expected reliability.⁵⁴⁹ Additionally, we ask how the collision risk associated with any failed satellites should be assessed. For example, should it be assumed that the maneuvering capability fails in the deployment orbit, in the orbit that presents the worst-case in terms of collision risk, some combination of both, or perhaps a range of orbits representing the expected range and duration of satellite operations? Are there methods by which we can apply historical data concerning the typical point in a satellite mission where failures occur in order to refine any analysis.⁵⁵⁰

161. In the event that we were to adopt some type of safe harbor approach, we seek comment on the review process for those systems that may not meet the safe harbor. One aspect of a more detailed assessment might be taking a closer look at the possible failure rate of maneuverability. As an example, if an applicant did not satisfy the safe harbor, the applicant could provide a more detailed demonstration that its actual failure rate for its maneuvering capabilities is expected to be significantly lower than the assumed rate of the safe harbor. We seek comment. If the system is a larger one that will have multiple deployments, one approach could be to include a license condition that would require the applicant to provide additional demonstrations if the actual failure rate for the initial deployments is substantially higher than the expected failure rate expressed in its application.⁵⁵¹ We seek comment on this approach and on other alternatives for assessing an expected failure rate on a more detailed basis.

⁵⁴⁷ In the *Order* we adopt a rule requiring that applicants demonstrate a 0.9 or greater probability of successful disposal for an individual satellite, with a goal of 0.99 or better for large systems. See Appendix A, Final Rules; see also ODMSP, 5-1.a. For deployments in the LEO region, we expect that in most cases systems will utilize the same capabilities used for collision avoidance, such as propulsion, to perform de-orbit maneuvers. See also, e.g., Hiber, Inc., SAT-PDR-20180910-00069, Letter from Tony Lin, Counsel to Hiber, Inc., Hogan Lovells US LLP to Marlene H. Dortch, Secretary, FCC, Attach. at 3-4 (April 15, 2019) (applicant indicating that with a satellite propulsion failure rate of 1/11 or higher, the aggregate lifetime collision probability for its planned 24 satellite system will exceed the 0.001 threshold); Kuiper Systems LLC, IBFS File No. SAT-LOA-20190704-00057, Letter from C. Andrew Keisner, Lead Counsel, Kuiper Systems LLC, an Amazon subsidiary to Jose P. Albuquerque, Chief, Satellite Division, FCC, at 5-6 (filed Sept. 18, 2019) (suggesting that a 5%, 10% or 15% failure rate of the fully deployed system would be well beyond what Amazon would view as expected or acceptable, but providing calculations of the probabilities of collision assuming a 5%, 10%, or 15% failure rate at the deployment "check-out" orbit of 350 km as well as the planned operational orbits of 590 km, 610 km, and 630 km).

⁵⁴⁸ Viasat suggests that we consider failures due to collisions with objects smaller than 10 cm in diameter when assessing what is a reasonable calculation of maneuverability failure rate. See Viasat Apr. 10, 2020 *Ex Parte* Letter at 5-6.

⁵⁴⁹ See SpaceX Apr. 16, 2020 *Ex Parte* Letter at 2 (expressing concern with requiring applicants to conduct assessments assuming a 10% failure rate that may not reflect real risk).

⁵⁵⁰ See, e.g., *id.* at 2-3 (suggesting that choosing a low injection orbit could help an operator "likely identify a large majority of satellites susceptible to failure at a time when they would naturally de-orbit within a matter of weeks, significantly reducing any chance for them to be involved in a collision.")

⁵⁵¹ See, e.g., Viasat Apr. 10, 2020 *Ex Parte* Letter at 3-4 (suggesting a number of detailed requirements regarding ongoing assessment of reliability utilizing several data points, and suggesting, among other things, conditioning (continued....))

162. We also seek comment on other aspects of a potentially more detailed review process for NGSO systems that cannot meet a particular safe harbor. Are there higher fidelity analyses that could provide the Commission with greater assurance that the risks are acceptable? Should applicants in these cases provide additional detail on the types of alternatives considered when designing their system, or measures that will be taken to reduce the total risk of collision? What measures might correlate with lower risk?⁵⁵² Are there specific measures that can be specified in a rule, with a goal of minimizing the need for a case-by-case approach?

163. Some commenters suggest that operators may attempt to disguise the true size of their systems in order to accept risk in excess of any total or aggregate collision risk benchmark.⁵⁵³ Should we consider establishing additional rules, such as attribution rules, to address this concern, or could it be adequately addressed on a case-by-case basis? In our experience, the operational characteristics of an application are often enough to indicate whether specific space stations are part of the same system or not, and we seek comment on addressing this issue through rule provisions at this time.

C. Maneuverability Above a Certain Altitude in LEO

164. In the *Notice*, the Commission sought comment on whether to adopt a requirement that all NGSO satellites planning to operate above a particular altitude have propulsion capabilities reserved for station-keeping and to enable collision avoidance maneuvers, regardless of whether propulsion is necessary to de-orbit within 25 years.⁵⁵⁴ We received a number of comments suggesting that all NGSO satellites or systems deployed above 400 km in the LEO region should have the capability to maneuver sufficient to conduct collision avoidance during the time when the spacecraft are located above 400 km.⁵⁵⁵ We seek comment on adopting such a requirement, including the costs and benefits of such a requirement. Would requiring maneuverability above a particular altitude help to ensure that the burden for conducting collision avoidance maneuvers is more evenly distributed among operators, since all Commission-authorized satellites would have some collision avoidance capability when operating in the upper part of the LEO region? To what extent would such a requirement enhance space safety in the LEO region?

165. We recognize that the costs and benefits of this type of approach are likely to be contingent to some extent on the altitude selected as the cut-off for maneuvering capabilities. While the majority of commenters who agreed that a requirement was necessary suggested 400 km as an appropriate

(Continued from previous page) _____

license grant on achieving certain metrics on a continuing basis, and conditioning authority to launch additional satellites in a constellation on satisfying suitable operational showings).

⁵⁵² See, e.g., Aerospace Comments at 19 (stating that aggregate collision risk can be mitigated by using operational orbits with low existing populations and employing collision avoidance); SpaceX Apr. 16, 2020 *Ex Parte* Letter at 2 (noting that some NGSO systems would operate at higher altitudes where debris will remain in orbit for decades or centuries, but also expressing concern about rules – such as 0.001 or less total collision probability - that could prevent licensing of systems that would operate above 900 km). See also NASA Large Constellation Study at 7 (“Because of the weak atmospheric drag above the 1000 km altitude, defunct spacecraft in that region have orbital lifetimes on the order of thousands of years or longer. They are a danger to the operations of [large constellations] and more importantly, are a long-term threat to the LEO environment – defunct spacecraft can and will collide with other debris over time, increasing the potential of generating more debris to trigger a collision cascade effect in the region.”). As discussed in the *Order*, we remain open to the possibility of active debris removal, as those technologies evolve.

⁵⁵³ See, e.g., Boeing Comments at 11; SpaceX Comments at 15.

⁵⁵⁴ *Notice*, 33 FCC Red at 11365, para. 34.

⁵⁵⁵ See, e.g., Iridium Comments at 6; OneWeb Comments at 11, 14-15; SpaceX Comments at 8; Amazon Reply at 4; see also Iridium *Ex Parte* Letter, Attach. at 6 (suggesting that non-maneuverable satellites should be limited to 400 km and below where they pose no risk to the ISS and will deorbit naturally within roughly two years).

cut-off, some parties suggested alternative altitudes, such as 600 or 650 kilometers.⁵⁵⁶ We seek comment on these various options. We observe that in the *Small Satellite Order*, the Commission decided to adopt a 600 km cut-off for a propulsion requirement, but also that the Commission explicitly left open the topic for further discussion as part of this proceeding, stating that broader concerns about a safe operating environment in the LEO region, as well as issues related to satellites transiting through the ISS orbit would be addressed in this proceeding.⁵⁵⁷ Some parties supporting a higher cut-off altitude note that academic and other research satellites, as well as commercial systems of small satellites, including CubeSats, are often deployed to altitudes between 400 km and 600 km.⁵⁵⁸ These commenters are generally concerned with the impact of a rule on the utility of CubeSats and on low-cost missions such as academic missions, since such small satellites may not have the volume or electrical capacity to support a propulsion system.⁵⁵⁹ Other commenters point out that a 400 km cutoff correlates with the approximate altitude where the ISS operates,⁵⁶⁰ and we seek comment on the extent to which a maneuverability requirement could help operators readily avoid the ISS, and thereby minimize the number of collision avoidance maneuvers that would need to be undertaken by the ISS. If we were to adopt a requirement tied to the operations of the ISS, we seek comment on requiring maneuverability during any period when satellites are “located in the LEO region in an orbit with an apogee above 400 km,”⁵⁶¹ for example, or whether there would be an alternative way to specify a cut-off orbital altitude. We observe that objects deployed below 400 km will typically re-enter Earth’s atmosphere in a very short time, within a few years at most, and in some cases CubeSats are deployed from the ISS, spending their mission below that altitude. We seek comment on balancing the potential benefits associated with requiring maneuverability for spacecraft located above 400 km with the potential impact to certain categories of satellite missions.

166. We also seek comment on whether the impact of a maneuverability requirement on certain small satellite missions could be minimized, such as through a gradual phase-in of a maneuverability requirement, with a grandfathering period of several years to accommodate those

⁵⁵⁶ See ORBCOMM Comments at 11 (suggesting that 650 km may be a reasonable altitude for this requirement); Letter from Blake E. Reid, Director, Samuelson-Glushko Technology Law & Policy Clinic, et al. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 1 (filed April 13, 2020) (University Small-Satellite Researchers *Ex Parte* Letter) (urging the Commission not to adopt a maneuverability requirement for small satellite missions operating below 600 km); Letter from Adonica Wada, Vice President, Regulatory Affairs & Compliance, Planet Labs Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 1 (meeting with IB staff) (filed Apr. 16, 2020) (Planet Apr. 16, 2020 *Ex Parte* Letter) (suggesting that the commission seek further comment on a maneuverability threshold of 600 km rather than 400 km); Letter from Tony DeTora, VP, Government Affairs, Lynk Global, Inc to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 2 (recommending that a maneuverability rule be applied only above 600 km).

⁵⁵⁷ *Small Satellite Order*, 34 FCC Rcd at 10392, 10394, 10395-96, paras. 42, 46, 48. Accordingly, we do not believe further consideration of the topic as part of this proceeding, including consideration of an altitude cut-off below 600 km, conflicts with the Commission’s determination in the *Small Satellite Order*.

⁵⁵⁸ See, e.g., CSSMA Reply at 7-8 (observing that imposing an orbital limit of 400 km for propulsion-less satellites would render them non-commercially viable with generally less than 1-year lifetimes); University Small-Satellite Researchers Reply at 2-3 (stating that it would be prohibitively expensive for university researchers to comply with propulsion requirements, and that mandating propulsion would effectively preclude university small-satellite missions from launching since many operate at altitudes between 400 and 600 km).

⁵⁵⁹ See, e.g., Planet Apr. 16, 2020 *Ex Parte* Letter, Attach. 2 at 3; University Small Satellite Researchers *Ex Parte* Letter at 2-3.

⁵⁶⁰ See, e.g., OneWeb Comments at 14-15; SpaceX Comments at 8; McKnight Comments at 3-4; Aerospace Comments at 10.

⁵⁶¹ For objects orbiting the Earth, the point in orbit that the object is farthest from the Earth is known as its “apogee.” The point in orbit that the object is closest to the Earth is known as the object’s “perigee.” These terms are used in several places in part 25 of our rules. See, e.g., 47 CFR § 25.114(6).

satellites already in advanced design and construction stages.⁵⁶² As technology continues to develop, is it increasingly feasible that even very small satellites could eventually accommodate propulsion systems or other generally reliable maneuvering capabilities? Alternatively, should we only apply such a requirement to larger systems of satellites, 100 or more for example, so that the number of non-maneuverable satellites overall above the ISS would be decreased without impacting academic and research missions or small commercial systems? Or should we provide a blanket exception for certain categories of satellites?

167. Additionally, we seek comment on what types of maneuverability could be deemed sufficient to reliably conduct collision avoidance maneuvers for purposes of this type of rule.⁵⁶³ For example, comments from NASA suggest that space stations using differential drag may not in some instances be able to reliably perform collision avoidance,⁵⁶⁴ but other commenters suggest that differential drag should be deemed sufficient.⁵⁶⁵ Some parties suggest that the Commission adopt a particular performance-based threshold for maneuverability to ensure that satellites are capable of changing their trajectory to avoid collisions.⁵⁶⁶ For example, Amazon suggests that satellites should be capable of maneuvering at least 5 km within 48 hours of receiving a conjunction warning.⁵⁶⁷ We seek comment on

⁵⁶² See, e.g., SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3-4; Planet Apr. 16, 2020 *Ex Parte* Letter, Attach. 2 at 6; Myriota *Ex Parte* Letter at 3.

⁵⁶³ See, e.g., CSSMA Comments at 10; Global NewSpace Operators Comments at 8; Boeing Comments at 19 (arguing that the Commission should allow satellites applicants to provide demonstrations that the techniques they propose to employ are adequate to enable responsive maneuvers); OneWeb Comments at 15 (stating that it does not oppose licensing of spacecraft using differential drag or similar mechanisms if operators can demonstrate that their reliance on these techniques facilitates timely collision avoidance); ORBCOMM Comments at 11 (suggesting that the Commission require “maneuverability” sufficient for collision avoidance and de-orbiting at end of life, since that option would provide satellite system operators with the flexibility to use other potential technologies that could accomplish the same goals); Aerospace Comments at 10 (stating that an object could avoid a collision as it transits a crewed spacecraft’s altitude using drag modification or some similar approach). See also SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 4 (expressing concern with an implication that non-propulsive maneuvering methods, such as differential drag, would no longer be permissible).

⁵⁶⁴ See NASA Comments at 5. NASA notes, for example, that utilization of differential drag does not provide the full range of collision avoidance functions that best protect safety of flight. NASA Comments at 5. NASA states that because the differential drag approach changes orbit trajectories much more slowly, it is necessary to act significantly earlier in the development of a typical collision avoidance event, using more coarse information which results in more mitigations than would be necessary otherwise. *Id.* NASA further notes that late-notice conjunction events cannot be addressed satisfactorily with differential drag methodology, or in some cases addressed at all. *Id.* at 5-6.

⁵⁶⁵ See, e.g., CSSMA Comments at 14; CSSMA Reply at 11-12 (supporting consideration by the Commission of differential drag as an effective means of preventing collisions and summarizing its members experience with differential drag); University Small-Satellite Researchers Comments at 2 (noting that university small satellite missions are increasingly investigating the employment of drag devices as means of collision avoidance, maneuverability, and facilitating deorbit).

⁵⁶⁶ See, e.g., Telesat Comments at 5 (stating that the spacecraft should be capable of performing timely and effective collision avoidance maneuvers sufficient to reduce probability of a collision per conjunction for the spacecraft to less than 0.001); Aerospace Comments at 10 (positing that the rule might be stated in terms of reducing the probability of collision to less than some threshold within a specified warning period, but not including a numeric suggestion); Amazon Reply at 5 (stating that in order to be considered sufficiently maneuverable for purposes of this requirement, satellites should be capable of maneuvering at least 5 km within 48 hours). NASA also observes in its comments that that electric propulsion, as presently employed, can be slow-acting and in general to mitigate conjunctions it is simply turned off (rather than sustain a change in thrust pattern) to alter the current trajectory. NASA Comments at 6.

⁵⁶⁷ Amazon Reply at 4-5.

whether there is a performance-based objective or other bright-line rule with respect to collision avoidance capabilities that the Commission could adopt that would provide certainty to applicants regarding their ability to satisfy any requirements in this area.⁵⁶⁸ Is the Amazon proposal in line with the type of maneuverability sufficient to conduct effective collision avoidance, or is a different demonstration of maneuverability appropriate? Should we consider how far in advance an operator would need to act if they deem a particular conjunction warning actionable? Do those operators with differential drag capabilities in fact use those capabilities to perform collision avoidance? Are there other indicia, such as ability of an operator to obtain accurate positional information for its satellites, that should be considered in assessing an applicant's ability to maneuver their satellites to avoid a collision? Is a bright line rule possible related to "effective" maneuverability, or a safe harbor provision? If case-by-case analysis is necessary,⁵⁶⁹ what type of analysis and/or supporting information should applicants provide to the Commission in order to facilitate review?

168. It is our understanding that on occasion a spacecraft will visit the ISS on a resupply mission, for example, then undock with the ISS and raise the spacecraft orbit to above the ISS before deploying satellites.⁵⁷⁰ If the Commission were to adopt a maneuverability requirement for space stations above 400 km, we seek comment on adopting a special exception for these types of missions, or addressing them on an ad hoc basis through the waiver process. We could consider factors such as whether these operations are already closely coordinated with NASA vis-à-vis the ISS, and are sufficiently unique that they are unlikely to result in a large numbers of non-maneuverable objects at altitudes above the ISS. We seek comment on these and any other relevant factors in evaluating exemptions or waiver requests for these special circumstances.

D. Post-Mission Orbital Lifetime

169. In the *Notice*, the Commission inquired whether the 25-year benchmark for completion of NGSO post-mission disposal by atmospheric re-entry remains a relevant benchmark, as applied to commercial or other non-Federal systems.⁵⁷¹ The 25-year benchmark has been applied in Commission licensing decisions for NGSO systems.⁵⁷² The NASA Standard and ODMSP specify a maximum 25-year post-mission orbital lifetime, with the revised ODMSP stating that for spacecraft disposed of by atmospheric reentry, the spacecraft shall be "left in an orbit in which, using conservative projections for solar activity, atmospheric drag will limit the lifetime to as short as practicable but no more than 25 years."⁵⁷³ Most commenters support a reduction in the 25-year benchmark as applicable to non-Federal systems,⁵⁷⁴ but others suggest that a 25-year benchmark is sufficient.⁵⁷⁵ We seek comment on how to

⁵⁶⁸ See, e.g., SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3-4 (expressing concern about lack of "objective or transparent" standards regarding the extent of maneuverability required); Boeing Apr. 16, 2020 *Ex Parte* Letter, Attach. at 2 (same); Planet Apr. 16, 2020 *Ex Parte* Letter at 1 (asking that the Commission provide specific guidelines regarding the standard for assessing maneuverability); Letter from Ananda Martin, General Counsel, Spire Global, Inc. to Marlene H. Dortch, Secretary, FCC at 1 (rec. April 16, 2020) (asking that the Commission identify a minimum maneuverability requirement).

⁵⁶⁹ See, e.g., Viasat Apr. 10, 2020 *Ex Parte* Letter at 3 (suggesting that a case-by-case approach may be preferable to overly-prescriptive rules in this context).

⁵⁷⁰ See, e.g., Spire Global, Inc., SAT-LOA-20151123-00078 (deployment of CubeSats from the OA-5 Cygnus launch vehicle into orbit above the ISS, after the launch vehicle docked with the ISS).

⁵⁷¹ *Notice*, 33 FCC Rcd at 11372-73, paras. 58-59.

⁵⁷² See 2004 *Orbital Debris Order*, 19 FCC Rcd at 11601-02, paras. 84-85.

⁵⁷³ ODMSP 4-1.b.

⁵⁷⁴ See, e.g., SpaceX Comments at 6; Iridium Comments at 8-9; Global NewSpace Operators Comments at 16; Intelsat Comments at 7; Maxar Comments at 13; OneWeb Reply at 5. See also Iridium *Ex Parte* Letter, Attach. at 8 (stating that in general, operators should aim to bring satellites down as quickly as possible following the end of

(continued....)

apply the ODMSP guidance that the post-mission lifetime be “as short as practicable but no more than 25 years.”⁵⁷⁶ Incorporating the 25-year metric into our rules may not incentivize commercial and other non-Federal operators to limit the post-mission orbital lifetime to “as short as practicable.” We ask whether a maximum 25-year limit on post-mission orbital lifetime would provide operators with any incentive to shorten post-mission time in orbit, or whether another approach might be preferable to encourage shorter post-mission orbital lifetimes to the extent possible.

170. As an initial matter, in the Order we observed that specifying post-mission orbital lifetime may be unnecessary for those satellites that would have maneuverability during the period when they are located above 400 km or for those satellites deploying and operating below 400 km, so any rule we adopt could apply just to those satellites in the Low Earth Orbit region not meeting those descriptions. Accordingly, if the Commission were to adopt the maneuverability requirements specified above that would apply to all satellites, we believe that it may be unnecessary to adopt a rule setting an upper limit for post-mission orbital lifetime for space stations in the LEO region. We believe that if maneuverability were required for space stations located above 400 km, or 600 km, for example, space stations will re-enter Earth’s atmosphere “as soon as practicable,” and well within 25 years, either because the space station already planned to operate below the specified altitude from which it would re-enter in a few years, or because the space station would be maneuvered down to an altitude below 400 km or 600 km, from which it would reenter within a few years.⁵⁷⁷ We seek comment. This approach has the benefit of being consistent with a shorter than 25-year post-mission disposal lifetime for spacecraft being disposed of by atmospheric re-entry, and is therefore consistent with the view of many commenters that acceptable post-mission disposal lifetimes should be reduced below 25 years for LEO spacecraft.

171. If there were some limited scenarios in which spacecraft with maneuverability will remain in orbit for significant amounts of time following the conclusion of the mission, more than five years, for example,⁵⁷⁸ we seek comment on whether the Commission should seek more information from the operator regarding the planned post-mission disposal lifetime, such as the reliability of collision avoidance during that extended period. Is there another approach that the Commission should take in such circumstances? Would these scenarios be sufficiently unlikely that a case-by-case approach would be reasonable, or is there a bright-line rule that should apply in what we believe would be these limited circumstances?

172. If the Commission does not adopt a maneuverability requirement of the type described above, we seek comment on what should be incorporated into the Commission’s rules regarding post-mission lifetime for space stations disposed of by atmospheric reentry that would not otherwise re-enter within a short period of time either because of maneuverability or very low deployment/operational altitude. We note that some commenters to the *Notice* suggest that post-mission orbital lifetimes on the

(Continued from previous page) _____

their mission, but should aim for a post-mission life of no more than 5 years for satellites operating at 2,000 km and below).

⁵⁷⁵ See, e.g., CSSMA Comments at 16; Aerospace Comments at 17; Boeing Reply at 21-22. See also NASA Comments at 7 (providing background on the 25-year disposal guideline, and noting that in analysis of the 25-year disposal guideline for large constellations over a 200-year period it found that the 25-year guideline remained a sufficient benchmark for limiting the growth in the debris environment).

⁵⁷⁶ ODMSP 4-1.b.

⁵⁷⁷ In the Order we discuss 400 km, as that closely correlates with short reentry timelines, but we observe that there are some slightly higher altitudes from which most space stations would re-enter as a result of atmospheric drag within short periods of time.

⁵⁷⁸ This scenario could occur where an operator plans to rely on atmospheric drag for re-entry, but reserves fuel sufficient to conduct collision avoidance maneuvers during the extended re-entry period.

order of five years may be appropriate in many cases.⁵⁷⁹ Some commenters also argue that the Commission should avoid adopting a “one-size-fits all” rule for post-mission orbital lifetime.⁵⁸⁰ Taking into consideration these views, should we encourage operators to dispose of their spacecraft “as soon as practicable” by adopting a presumptively acceptable post-mission orbital lifetime of five years, for example, but allow applicants to provide additional demonstrations in support of a longer post-mission lifetime in circumstances when they are unable to achieve a five-year disposal? Is five years the right length of time for this type of a safe-harbor provision? Demonstrations in support of a longer post-mission lifetime could include information demonstrating that the applicant considered reasonable alternatives, as well as information regarding planned deployment orbit, and the ratio of the mission lifetime to the post-mission lifetime. Would this type of safe harbor approach provide sufficient certainty to applicants will enabling flexibility? Using the ODMSP guideline, what factors should the Commission consider in determining whether a particular post-mission orbital lifetime is “as short as practicable?” Or, should we simply adopt a requirement that satellites in the LEO region be removed from orbit as soon as practicable, but no more than five years following the end of the mission?

E. Casualty Risk Assessment

173. *Casualty Risk and Design for Demise or Targeted Re-entry.* The revised ODMSP states that for those spacecraft disposed of by re-entry into Earth’s atmosphere (either by disposal maneuver or using atmospheric drag alone) the risk of human casualty from surviving components with impact kinetic energies greater than 15 joules should be less than 0.0001(1 in 10,000).⁵⁸¹ The ODMSP also states that “[d]esign-for-demise and other measures, including reusability and targeted reentry away from landmasses, to further reduce reentry human casualty risk should be considered.”⁵⁸² The Commission has long encouraged satellite designers to consider “design for demise” when choosing materials for satellite construction⁵⁸³ – and we observe that in some instances it may be relatively easy for a satellite design to select materials that will fully burn up in the atmosphere or have impact kinetic energies of less than 15 joules.

174. Given the guidance in the ODMSP, we seek comment on whether we should adopt additional rule revisions concerning strategies to lower casualty risk. For example, we could adopt a presumptively acceptable (i.e. safe harbor) human casualty risk threshold of zero – achievable through either design for demise or planned targeted reentry, and only require additional information from applicants regarding casualty risk such as a description of whether the applicants had considered such strategies to lower casualty risk, where the calculated casualty risk is greater than zero. Under this approach, the Commission could approve satellites with casualty risk up to the maximum of 1 in 10,000, but asking applicants to provide additional information when the calculated casualty risk is greater than zero could help to ensure that applicants are considering strategies such as design for demise and targeted

⁵⁷⁹ See, e.g. SpaceX Comments at 6; Iridium Comments at 8-9; Global NewSpace Operators Comments at 16; Intelsat Comments at 7; Maxar Comments at 13; OneWeb Reply at 5.

⁵⁸⁰ See, e.g., AMSAT Comments at 5; Global NewSpace Operators Comments at 16; University Small-Satellite Researchers Comments at 12-13; AMSAT Reply at 2; University Small-Satellite Researchers Reply at 7-9.

⁵⁸¹ ODMSP, 4-1.a.b.

⁵⁸² *Id.* at 4-1.a.

⁵⁸³ For example, in 2013, the International Bureau and Office of Engineering and Technology issued a public notice providing *Guidance on Obtaining License for Small Satellites (Small Satellite PN)*, which stated that satellite designers are urged and expected to follow a “design to demise” approach in choosing materials. *Guidance on Obtaining License for Small Satellites Public Notice*, 38 FCC Rcd 2555, 2558 (IB/OET 2013). The *Small Satellite PN* also stated that in the event an assessment of the spacecraft re-entry finds surviving materials presenting a casualty risk other than zero, the applicant should provide in its application a detailed discussion of the need for use of high melting point materials, demonstrating that mission objectives cannot be met with an alternative spacecraft design. *Id.* at n.9.

re-entry, consistent with the ODMSP. We seek comment on the pros and cons of such an approach for ensuring that operators are not unnecessarily running casualty risk. As an alternative, are there other safe harbor approaches or bright-line rules with respect to design for demise and targeted re-entry that could be adopted by the Commission?

175. *Cumulative Casualty Risk.* We also seek to develop the record further on consideration of casualty risk on a system-wide basis. In response to the *Notice*, some commenters raised concerns with consideration of casualty risk on an aggregate basis.⁵⁸⁴ As noted, the revised ODMSP states, with respect to “large constellations,” that cumulative re-entry human casualty risk should be limited.⁵⁸⁵ Consistent with this guidance, we observe that large constellations could raise additional concerns about human casualty risk when calculated cumulatively for all the satellites in the constellation, even if each individual satellite has a casualty risk that is less than 1 in 10,000. While these concerns can in many cases be addressed through designing satellites for demise and direct re-entry strategies, we seek comment on reviewing the cumulative risk associated with larger systems to determine if such systems have in fact limited cumulative risk. We seek comment on whether there is a particular metric we should apply to multi-satellite systems? Should a cumulative metric apply based on the number of satellites in the system, similar to the ODMSP, which defines a “large constellation” as more than 100 satellites? Should the number of satellites include consideration of replacement/replenishment satellites over a 15-year license term? One approach could be a safe harbor similar to some of the concepts described above, wherein a system satisfying a 1 in 10,000, or other risk metric system-wide would satisfy the safe harbor threshold, such that no further analysis of risk would be required. We seek comment on this safe harbor approach and a reasonable risk metric for a safe harbor. For systems not satisfying the safe harbor, applicants could provide the Commission with additional demonstrations that the applicants have limited the cumulative casualty risk associated with the system. In assessing these demonstrations, the Commission could consider factors such as the total number of satellites, the per-satellite casualty risk, and whether the applicant has considered factors such as targeted disposal – and, if so – the expected reliability of targeted disposal. We seek comment on this approach, and how the Commission should consider these or other factors in assessing cumulative casualty risk. Alternatively, should the Commission try to adopt a bright-line rule applicable in these cases,⁵⁸⁶ or is there a maximum cumulative risk above which the Commission should not authorize a system? Several commenters suggest that we consider a per-year or annualized casualty risk rate approach, and we alternatively seek comment on this approach and how it might be implemented as part of the licensing process.⁵⁸⁷ Similar to the discussion above regarding total collision risk, we additionally seek comment on whether we need to adopt attribution rules or other rules to address a situation where operators may attempt to disguise the true size of their systems in order to accept risk in excess of any cumulative risk benchmark.

F. Indemnification

176. In the *Notice*, we sought comment on the adoption of an indemnification requirement as part of a broader discussion of liability issues and economic incentives.⁵⁸⁸ In response to concerns and questions expressed by various commenters, we seek additional comments on this issue in order to obtain

⁵⁸⁴ See, e.g., Boeing Comments at 33; SpaceX Reply at 1; Boeing Reply at 38; Boeing Feb. 14, 2020 *Ex Parte* Letter at 11; Amazon Reply at 2-3 (arguing generally that standards and metrics should be applied on a per-satellite basis). See also NASA Comments at 7. The *Notice* sought comment on whether the Commission should assess human casualty risk on a system-wide basis, and if so, what metric should be used to evaluate aggregate risk. *Notice*, 33 FCC Red at 11374, para. 62.

⁵⁸⁵ ODMSP, 5-1.b.

⁵⁸⁶ See, e.g., Amazon *Ex Parte* Letter at 4 (expressing concern with case-by-case assessments when the system-wide reentry risk is greater than zero).

⁵⁸⁷ See Iridium Comments at 10; OneWeb Reply at 6.

⁵⁸⁸ *Notice*, 33 FCC Red at 11378, para. 78.

a fuller record. We also seek comment on whether any indemnification requirement should be addressed as a license condition and affirmed as part of the application process rather than as a separate agreement following licensing in order to address concerns raised by some commenters concerning the details of implementation.⁵⁸⁹

177. As the Commission specified in the *Notice* and previously explained in detail in the 2004 *Orbital Debris Order*, under international law, the United States government could potentially be presented with a claim for damage resulting from private satellite operations.⁵⁹⁰ Specifically, the United States is party to two international treaties addressing liability arising from activities in outer space⁵⁹¹—the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies (Outer Space Treaty)⁵⁹² and the Convention on International Liability for Damage Caused by a Space Object (Liability Convention).⁵⁹³ The Outer Space Treaty and Liability Convention, were signed by the United States and ratified by Congress, and thus have the force and effect of federal law. Article VI of the Outer Space Treaty states in part that, “State Parties to the Treaty shall bear international responsibility for national activities in outer space . . . whether such activities are carried on by governmental agencies or by non-governmental entities,” and that, “[t]he activities of non-governmental entities in outer space . . . shall require authorization and continuing supervision by the appropriate State Party to the Treaty.”⁵⁹⁴ Under Article VII of the Outer Space Treaty, a State Party to the Treaty that “launches or procures the launching of an object into outer space . . . and each State Party from whose territory or facility an object is launched, is internationally liable for damage to another State Party to the Treaty or its natural or juridical persons by such object or its component parts on the Earth, in air or in outer space[.]”⁵⁹⁵ The Liability Convention specifies that liability rests with a “launching state,” which is defined as either (1) a State which launches or procures the launching of a space object, or (2) a State from whose territory or facility a space object is launched.⁵⁹⁶ The Liability Convention contains both strict liability (Article II) and fault-based liability (Article III) provisions.⁵⁹⁷ The launching state is strictly liable for damage caused by its space object on the surface of the earth or to an aircraft in flight.⁵⁹⁸ In the event of damage being caused elsewhere than on the surface of the earth to a space object of one launching state or to persons or property on board such a space object by a space object of another launching state, the launching state “shall be liable only if the damage is due to its fault or the fault of persons for whom it is responsible.”⁵⁹⁹ The treaty also provides for joint and

⁵⁸⁹ See Appendix D.

⁵⁹⁰ *Notice*, 33 FCC Rcd at 11378, para. 77; 2004 *Orbital Debris Order*, 19 FCC Rcd at 11613-14, paras. 109-113.

⁵⁹¹ Full text of these U.N. treaties is available at <https://www.unoosa.org/oosa/en/ourwork/spacelaw/treaties.html>.

⁵⁹² Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies, October 10, 1967 (Outer Space Treaty).

⁵⁹³ Convention on International Liability for Damage Caused by Space Objects, September 1, 1972 (Liability Convention).

⁵⁹⁴ Outer Space Treaty, Article VI.

⁵⁹⁵ Outer Space Treaty, Article VII. As the Commission noted in the 2004 *Orbital Debris Order*, the definition of “space object” includes “component parts of a space object,” which would arguably incorporate orbital debris resulting from satellite operations. *Orbital Debris Order*, 19 FCC Rcd at 11612-13, para. 109.

⁵⁹⁶ Liability Convention, Article I.

⁵⁹⁸ Liability Convention, Article II.

⁵⁹⁹ Liability Convention, Article III.

several liability in certain circumstances, including where more than one State can be considered a “launching state.”⁶⁰⁰

178. Regardless of whether a particular claim results in a payment of compensation, the United States would incur costs in addressing such claims, and those costs would be borne by U.S. taxpayers. Thus, there is a connection between the Commission’s issuance of a license for satellite communications and exposure of the U.S. government to claims under international law, particularly because the Commission is often the only agency reviewing an operator’s plans for on-orbit operations and orbital debris mitigation, including post-mission disposal activities. Under these circumstances, conditioning Commission authorization on indemnification of the U.S. government may be a reasonable step, given the absence of protections under international law of the protection from liability under U.S. law related to a licensing authority’s exercise of its discretionary functions. We seek comment on these considerations.

179. Some commenters question whether an indemnification requirement is necessary because the U.S. government could initiate a civil action to secure recovery from the relevant operator.⁶⁰¹ Boeing states that the U.S. could recover under a claim of contribution, claim of equitable tort indemnification, or claim of equitable apportionment.⁶⁰² It does not appear that the theories Boeing presents have been tested in the context of the treaty-based liability involved here.⁶⁰³ We seek comment and any supporting legal analysis concerning whether these alternative avenues are in fact an available means for recovery with respect to the full range of claims that might arise under international law related to space activities. If so, and as observed by some commenters, an FCC indemnification requirement may be an unnecessary formal step to acknowledge an existing legal obligation of licensees engaged in space activities. We seek comment on this view. We also seek comment and supporting legal analysis on whether there are any applicable limitations on liability inherent in these alternative approaches to recovery. For example, are there any provisions in the governing laws that express a legislative intent to limit or exempt from liability activities that may trigger a claim under international law or that are extra-territorial in scope?

180. Several commenters request that the Commission provide additional legal analysis regarding Commission authority for adopting an indemnification requirement, or otherwise question the Commission’s jurisdiction in this area.⁶⁰⁴ As discussed above in the Order, our conclusion is that the

⁶⁰⁰ See Liability Convention, Article V.

⁶⁰¹ Boeing Comments at 37-39; Boeing Reply at 43. See also SIA Apr. 15, 2020 *Ex Parte* Letter at 5 (requesting that the Commission seek comment on whether existing civil action procedures are currently available to the U.S. government that may obviate the need for a Commission indemnification requirement). Relatedly, some parties suggest that the Commission should refrain from adopting any requirements in this area because it has not specified an example where the U.S. government has faced liability or damages as a result of orbital debris from a commercial satellite system licensed by the Commission. See, e.g., Boeing Comments at 37; Boeing Reply at 43; EchoStar/Hughes Apr. 10, 2020 *Ex Parte* Letter, Attach. at 1; Letter from Jessica B. Lyons, AT&T Services, Inc., Jennifer A. Manner and Kimberly M. Baum, EchoStar Satellite Services L.L.C. & Hughes Network Systems LLC, Susan H. Crandall and Cynthia J. Grady, Intelsat License LLC, and Nancy Eskenazi, SES Americom, Inc. to Marlene H. Dortch, Secretary, FCC, IB Docket No. 18-313, at 2 (filed April 14, 2020) (U.S. GSO Operators Apr. 14, 2020 *Ex Parte*).

⁶⁰² Boeing Comments at 37-39.

⁶⁰³ Boeing cites to a number of specific cases that it argues support these theories of recovery. See Boeing Comments at 38, n. 91.

⁶⁰⁴ See Intelsat Comments at 12; Space Logistics Comments at 13; Intelsat Comments at 12; Boeing Comments at 37-38; SIA Comments at 9; Telesat Comments at 11. See also SIA Apr. 15, 2020 *Ex Parte* Letter at 2 (stating that the Commission “cites no statutory authority” for this requirement); Space Logistics Comments at 13 (stating that the Commission cannot promulgate insurance or indemnification requirements under ancillary authority). Since we focus on the authority for the Commission to adopt an indemnification requirement as deriving from the same

(continued....)

Commission has authority, pursuant to the Communications Act, to review and assess orbital debris mitigation plans as part of its public interest analysis in issuing licenses for space station communications. As noted, Title III of the Act provides for the licensing of radio communications, including satellite communications, only upon a finding that the “public convenience, interest, or necessity will be served thereby.”⁶⁰⁵ We consider an applicant’s plan to mitigate orbital debris risks to be a relevant public interest factor in approving an applicant’s space station operations, and the analysis undertaken by the Commission is designed to ensure that space systems reviewed by the Commission have sufficient plans to mitigate orbital debris, consistent with the public interest. We seek additional comment on whether the same sources of authority provide a sufficient basis for an indemnification requirement. As a policy matter, a clear indemnification requirement may strengthen the incentives of applicants to mitigate risk, by ensuring that licensee’s consider in their planning and decision making the costs that could be associated with any claim brought under the relevant Outer Space Treaties. In this way, ensuring that the licensee has agreed to indemnify the U.S. government in those circumstances could be viewed as an economic aspect of ensuring that the more technical aspects of orbital debris mitigation are fully considered by licensees. Additionally, incorporating indemnification as part of a sufficient orbital debris mitigation plan may further the public interest by ensuring that U.S. taxpayers are not ultimately responsible for defraying costs resulting from the activities of non-government entities in the event of a claim under international law. We seek comment on these questions.

181. Several commenters to the *Notice* argue that in other regulatory contexts, Congress has directly addressed the role of regulatory agencies with respect to liability and indemnification issues, but argue that here, Congress has not provided the Commission with specific authority concerning indemnification.⁶⁰⁶ We seek comment and supporting legal analysis on whether these expressions of legislative intent preclude the adoption of an indemnification requirement for FCC. We observe that in several examples cited by commenters, Congress provided for indemnification related to specific types of activities and did not address FCC-licensed activities. We also note that in some instances, Congress has sanctioned acceptance of liability by the U.S. government within certain ranges.⁶⁰⁷ An example of this is the liability risk-sharing regime for commercial space transportation, addressed by statute and implemented by the FAA.⁶⁰⁸ Under the statute, launch or re-entry licensees obtain insurance to cover claims of third parties against launch or reentry participants, including the licensee, its customer, and the U.S. government and agencies and any contractors or subcontractors.⁶⁰⁹ The FAA sets insurance requirements based upon the FAA’s determination of the maximum probable loss that would result from the licensed launch or reentry activities, within statutory ceilings.⁶¹⁰ Subject to appropriations, the U.S. government may pay successful third-party liability claims in excess of the required maximum probable loss-based insurance, up to \$1.5 billion (as adjusted for post-1989 inflation) above the amount of the maximum probable loss-based insurance.⁶¹¹ For claims in excess of the maximum probable loss-based

(Continued from previous page) _____

authority of the Commission to review debris mitigation plans, we do not address the issue of ancillary authority, but to the extent that commenters believe this issue may be relevant, we invite comment.

⁶⁰⁵ 47 U.S.C. § 307(a).

⁶⁰⁶ See SIA Comments at 9; Intelsat Comments at 13-14. See also Boeing Comments at 38-39.

⁶⁰⁷ See Intelsat Comments at 13, n. 29. As one example from the statutes cited by Intelsat, the Nuclear Regulatory Commission has been given the authority to indemnify licensees from public liability arising from nuclear incidents which is in excess of the level of financial protection required of the licensee, 42 U.S.C. § 2210(c).

⁶⁰⁸ Commercial Space Launch Act, 51 U.S.C. § 50901, *et seq.* (1994); 14 CFR part 440.

⁶⁰⁹ See 51 U.S.C. § 50914.

⁶¹⁰ See *id.*; 14 CFR § 440.9.

⁶¹¹ See 51 U.S.C. 50915; 14 CFR § 440.19.

insurance plus government indemnification, the licensee or legally liable party is responsible.⁶¹² We seek comment and any supporting legal analysis on whether the fact that Congress addressed third-party liability as it relates to, for example, launches authorized by the FAA, implies that Congress explicitly or implicitly precluded the Commission from addressing liability issues related its regulation under Title III, including review of on-orbit and disposal activities.⁶¹³ We observe that the liability regime for launch activities specified by statute and in FAA rules does not appear to address post-launch issues arising from damages caused by a “launch payload” after a nominal launch is concluded.⁶¹⁴

182. In response to the *Notice*, Intelsat requests that the Commission conduct an analysis of whether other governmental agencies would be better suited to decide whether to impose indemnification requirements on space station licensees in the first instance. Specifically, Intelsat requests that we conduct an analysis with respect to the Department of State.⁶¹⁵ We do not believe it is the Commission’s role to opine on the suitability of agencies for particular activities. However, we seek comment on whether there are any authorities granted by statute or developed through regulation, in addition to those already identified in the record, that may have relevance to a possible FCC indemnification requirement. SIA also raises the question of whether there should be a distinction in an indemnification provision between liability based on fault and liability that results from the strict liability provision of the Outer Space Treaties.⁶¹⁶ The Liability Convention includes some fault-based provisions, and some strict liability provisions (for damage caused by its space object on the surface of the earth or to an aircraft in flight).⁶¹⁷ For a claim brought under the Outer Space Treaties, a State party to the treaty could be found liable based upon the particular provision at issue, whether that provision was fault-based, or strict liability – in accordance with the terms of the treaty. SIA asks, in effect, whether, for strict liability, there should also be a determination of fault on the part of the non-governmental operator as a pre-condition to requiring indemnification, and if so, how such a determination might be made. We seek comment on the questions raised by SIA.

183. *Costs.* Most of the commenters addressing this issue in response to the *Notice* argue that the costs of the indemnification requirement to operators would outweigh any potential benefits.⁶¹⁸ Some commenters argue that such a requirement would be contrary to U.S. national interests in promoting innovation and competitiveness and ensuring that the United States is the jurisdiction of choice for space

⁶¹² *Id.*

⁶¹³ *See, e.g.,* Space Logistics Comments at 11-12, n.34.

⁶¹⁴ Satellites would typically be considered part of the “launch payload.” *See* 14 CFR § 401.5 (defining “payload” as an object that a person undertakes to place in outer space by means of a launch vehicle, including components of the vehicle specifically designed or adapted for that object). Title 14, part 440, subpart A of the FAA regulations establishes the financial responsibility and allocation of risk requirements for launch or reentry authorized by FAA license or permit under the regulations governing commercial space transportation. 14 CFR § 440.1. “Licensed activity” means the launch of a launch vehicle or the reentry of a reentry vehicle conducted under a license the FAA issues. 14 CFR § 440.3. “Permitted activity” means the launch or reentry of a reusable suborbital rocket conducted under a permit issued by the FAA. *Id.*

⁶¹⁷ *See* Liability Convention, Article II.

⁶¹⁸ AT&T Comments at 6 (arguing that an indemnification requirement would impose unnecessary burdens on operators while failing to meaningfully change licensee behavior); Space Logistics Comments at 9 (disagreeing specifically with indemnification proposal for GSO space stations); Boeing Comments at 38-39; Space Logistics Comments at 9-11; Lockheed Martin Comments at 18-19; *see also* AT&T Reply at 9; Sirius XM Reply at 4; Boeing Reply at 43.

activities.⁶¹⁹ Along these lines, some parties suggest that an indemnification requirement could lead to forum shopping, wherein entities apply for licenses from foreign administrations rather than the United States.⁶²⁰ Some parties also ask the Commission consider including a cap on a U.S. licensee's potential liability, both in terms of timing and duration.⁶²¹ We make several observations and seek additional comment on these issues, noting that we also seek to foster innovation and to encourage the development of new services and technology, and through the indemnification requirement would seek to achieve the goal of limiting taxpayer liability at a relatively minimal cost for responsible operators.⁶²²

184. We seek comment on the actual costs that operators believe they will incur as a result of this requirement as proposed in the draft rule (i.e., without adopting a “cap” on liability), including the costs to those entities that are publicly traded.⁶²³ We observe that operators would have the choice whether or not to purchase insurance to cover certain liabilities, depending on individualized needs. Although the Order does not adopt an insurance requirement at this time, we seek comment on the availability and costs of insurance,⁶²⁴ noting that some other countries require insurance for the types of activities that would be covered by the proposed indemnification requirement.⁶²⁵ Some parties characterize the uncertainty associated with liability as an issue from the perspective of filings with the Securities and Exchange Commission (SEC).⁶²⁶ Additionally, we seek comment on potential costs of indemnification for non-commercial entities, such as those that may be applying under the Commission's

⁶¹⁹ See, e.g., CSSMA Comments at 20; Lockheed Martin Comments at 18-19 (stating that imposing “stringent” indemnification obligations on U.S. applicants and licensees could dissuade satellite applicants from seeking U.S. authorization); Spaceflight Comments at 6 (stating that adding new FCC indemnification and insurance requirements on top of the requirements already in place by the FAA, for example, could have a negative impact on the U.S. space market). See also OneWeb Comments at 30-31 (stating that this could discourage non-U.S.-licensees from seeking market access to provide services in the United States).

⁶²⁰ See, e.g., CSSMA Comments at 20; Lockheed Martin Comments at 18-19 (stating that imposing “stringent” indemnification obligations on U.S. applicants and licensees could dissuade satellite applicants from seeking U.S. authorization); Spaceflight Comments at 6 (stating that adding new FCC indemnification and insurance requirements on top of the requirements already in place by the FAA, for example, could have a negative impact on the U.S. space market); SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 2 (stating that an indemnification requirement could lead to forum shopping). See also OneWeb Comments at 30-31 (stating that this could discourage non-U.S.-licensees from seeking market access to provide services in the United States).

⁶²¹ See, e.g., SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3.

⁶²² SIA Comments at 9-10 (arguing that the Commission has not considered the potential for frivolous litigation). Space Logistics similarly argues that indemnification would increase litigation exposure for U.S. licensees both in terms of the direct assumption of liability and the potential that other parties could claim a right to sue the indemnifying party based on the indemnification requirement. Space Logistics Comments at 10.

⁶²³ See SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3.

⁶²⁴ See, e.g. SIA Comments at 9 (stating that the proposal is “vague and untenable”); Global NewSpace Operators Comments at 19 (stating that currently only 5% of LEO satellites are subject to on-orbit insurance, so the insurance industry would need to mature significantly to expand into this area); ORBCOMM Comments at 19 (raising concerns about whether it will be possible for satellite system operators to obtain insurance at reasonable rates and about operators defaulting on obligations, rendering a requirement ineffective and unenforceable); CSSMA Comments at 21 (stating that in more serious circumstances, losses would likely not be insurable and a licensee would not be able to pay); Boeing Reply at 44 (unclear whether insurance for the entire life of the satellite could be obtained on reasonable terms).

⁶²⁵ See, e.g., UK Space Agency, Guidance; License to operate a space object: how to apply; Obligations of licensees, <https://www.gov.uk/guidance/apply-for-a-license-under-the-outer-space-act-1986#space-liability-and-insurance-requirements> (discussing third-party liability insurance requirements for in-orbit activities).

⁶²⁶ See EchoStar/Hughes Apr. 10, 2020 *Ex Parte* Letter, Attach. at 1; SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3.

experimental or amateur rules, while observing that the operation of a space station, may present the same risks in terms of potential U.S. government liability regardless of whether the operator is an amateur, non-profit, commercial entity, etc.

185. We observe that several other countries require indemnification and insurance as part of their licensing processes.⁶²⁷ We seek comment and legal analysis on the extent to which indemnification and insurance requirements are used in the regulatory structures of other countries, and the extent to which these requirements are a substantial or dominant consideration as operators select the country in which they base their “regulatory home.”

186. We seek comment on a concern raised by a number of commenters related to capping potential liability for a U.S. licensee under any indemnification requirement.⁶²⁸ We seek comment on whether a cap on the amount of any indemnification requirement, as included in a number of indemnification requirements adopted by other countries, would serve the public interest. We also seek comment on whether, to the extent any such cap implies that the Commission is making a determination concerning the scope of risk accepted on behalf of the United States, such a determination is within the scope of the Commission’s authority. Additionally, if an upper limit on the indemnification were to be adopted, we seek comment on a value for that upper limit. We observe that the United Kingdom, for example, has adopted a cap of 60 million euros (per-satellite, since satellites are licensed individually) that applies to those missions not considered higher-risk.⁶²⁹ We seek comment on whether a comparable amount, converted to U.S. dollars, would be a reasonable cap on indemnification of the U.S. government by licensees in these circumstances.

187. *Implementation.* In the *Notice*, the Commission sought comment on the means to execute documents related to indemnification, and proposed rule text implementing the requirement.⁶³⁰ After further consideration and in response to comments that noted some potential issues with the procedures proposed, we are seeking comment on whether an indemnification requirement should be implemented through license condition, or through a document provided by the licensee prior to license grant.⁶³¹ For example, should any indemnification requirement be implemented by having applicants include a signed statement regarding indemnification, which will be standardized, along with the other information provided in their application. We seek comment on this proposal and on any specific terms or conditions of indemnification that might be appropriate. In describing the obligation of licensees in our application rules, we propose language that is similar to what we proposed in the *Notice*, but in response to comments make clear that any indemnification obligation would be associated with claims brought under the Outer Space Treaties.

⁶²⁷ In the United Kingdom, for example, the U.K. Outer Space Act of 1986 requires that a party carrying out certain space activity indemnify the government against claims arising out of that activity. See UK Space Agency, Guidance; License to operate a space object: how to apply; Obligations of licensees, <https://www.gov.uk/guidance/apply-for-a-license-under-the-outer-space-act-1986#space-liability-and-insurance-requirements>. Several other nations similarly have requirements with respect to indemnification.

⁶²⁸ See SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3.

⁶²⁹ As of 2015, the licenses issued by the U.K. state a limit to the operator’s liability arising from the licensed activities. This cap is set out by license conditions and determined by the U.K. Space Agency on a case-by-case basis, but for what the U.K. characterizes as “standard missions,” the cap is 60 million euros per licensed satellite. See UK Space Agency, Guidance; License to operate a space object: how to apply; Obligations of licensees, <https://www.gov.uk/guidance/apply-for-a-license-under-the-outer-space-act-1986#space-liability-and-insurance-requirements>.

⁶³⁰ *Notice*, 33 FCC Red 11379, para. 79.

⁶³¹ ORBCOMM, for example, expresses concern regarding a lack of uniformity for the indemnification agreement. ORBCOMM Comments at 19. Applying the indemnification requirement as a license condition could help to ensure uniformity.

188. We also seek comment on any implementation issues related to any adoption of an indemnification requirements. As a possible approach, applicants whose applications for U.S. licenses are pending at the time the rule becomes effective could be required to file an amendment with the indemnification statement.⁶³² We seek comment. We also seek comment on the treatment that should be afforded to existing licensees, including in the event of license modification filed after any requirement is adopted. Additionally, we seek comment on the appropriate approach for assignments and transfers of licenses.

189. Additionally, we seek comment on alternative implementation arrangements. SIA suggests that it may be appropriate for satellites in orbit or under construction as of November 15, 2018, the date the *Notice* was adopted, to be grandfathered.⁶³³ We seek comment on whether any indemnification requirement should be associated with the timing of licensing or construction of particular satellites, rather than with the timing of when the license is granted, or whether there are other benchmarks that should define applicability of any requirement adopted.

190. *Market Access.* We seek comment on the issue of indemnification by market access grantees, in other words, non-U.S.-licensed space stations granted access to the United States market.⁶³⁴ In the majority of instances we would not require an indemnification agreement for a non-U.S.-licensed operator authorized for U.S. market access, as the relevant countries will have taken actions that associate the satellite operations with their national regulatory structure and will have identified the relevant State parties to the Outer Space Treaty. However, there are some cases in which the goals of any indemnification requirement might be served by requiring indemnification from operators of satellites granted market access. For example, some countries submit filings to the ITU on behalf of a satellite operator, but decline to take any responsibility with respect to the provisions of the Outer Space Treaties. In a situation where there is no other country taking such responsibility, and the applicant has substantial connections to the United States, to the point that those predominate perception of the country that may be responsible for supervision, indemnification may be appropriate.⁶³⁵ We seek comment on whether in these cases, involving so-called “flag of convenience,” requiring indemnification may be appropriate for licensing purposes.⁶³⁶ We also seek comment on any specific factual and regulatory indicators that should be used to identify such cases. Should factors such as registration of the satellite with the United Nations, ownership and operation of the space station by a U.S. company from a U.S. network control center, or other factors be considered?

191. *Other Unique Implementations.* We observe that in some instances the United States, through a government contract promulgated by an agency or other entity (e.g., NASA), may have agreed to indemnify an operator against certain claims. In these instances where an operator believes that the United States has indemnified the operator, we propose that the applicant could provide a demonstration of these circumstances, which would provide a basis for exempting the applicant from the indemnification requirement. We seek comment on this and any other unique situations in which an indemnification requirement might run contrary to allocations of responsibility between governmental and non-

⁶³² This would also potentially include market access applications to the extent that they fit the profile described below, where the United States would likely be considered a “launching state,” and the Commission could notify such applicants.

⁶³³ SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3.

⁶³⁴ We note that this could also include an application filed by an earth station operator requesting communications with a non-U.S.-licensed satellite, either under parts 5 or 25.

⁶³⁵ See proposal above (excepting applicants from the indemnification requirement where non-U.S.-licensed space stations are involved, except as determined by the Commission on a case-by-case basis).

⁶³⁶ See SIA Apr. 15, 2020 *Ex Parte* Letter, Attach. at 3. The example provided indicates some of the characteristics we would associate with a “flag of convenience” for licensing purposes – including essentially no regulation of space activities and no plan to register the satellite with the United Nations.

governmental actors, established in law or regulation. As an example, University Small-Satellite Researchers suggest that in some cases state institutions, such as universities, may not be able to accept liability and risk for third parties due to sovereign immunity provisions.⁶³⁷ We seek comment on any possible limitations in this area that should be considered. To the extent that the bar on indemnification of third parties is associated with concerns about waiving governmental immunity, we observe that the third party in this instance would be the federal government, and we believe this may present a different factual scenario for universities when it comes to waiving governmental immunity. However, we seek comment and supporting legal analysis on this point.

192. Additionally, AMSAT and ARRL suggest that we add the word “owners” to an indemnification provision in the amateur rules, so that the owners of an amateur satellite could be the indemnifying parties rather than the individual amateur licensees.⁶³⁸ We seek comment on this approach, and also on how to define “owner” for purposes of the amateur rules. We further seek comment on how we would ensure that the indemnification requirement remains valid in the event that the ownership changes for an amateur space station.

G. Performance Bond for Successful Disposal

193. In the *Notice*, the Commission had mentioned bonds as an example of an economic incentive, but had not made a specific proposal. In this Further Notice, we seek comment on whether a performance bond tied to successful post-mission disposal may be in the public interest, as applicable to space station licensees. Essentially, we seek comment on adopting a requirement that space station licensees post a surety bond, similar to what they already do for spectrum use, that would be returned once the space stations authorized have successfully completed post-mission disposal. What are the costs and benefits of a performance bond approach?

194. In response to the mention of a post-mission disposal bond in the *Notice*, some commenters expressed disagreement with the idea.⁶³⁹ According to Eutelsat, a performance bond requirement related to satellite end-of-life would cover what are typically unanticipated events that occur despite a proponent’s best effort, and collection under a performance bond would not mitigate the result of such unanticipated events.⁶⁴⁰ We believe this topic is worth further discussion, however, and observe that there may be benefits to a performance bond, despite the fact that even where the bond is forfeited the unsuccessful satellites would remain in orbit. Several commenters to the *Notice* suggest that there is difficulty in ensuring that entities follow through with their planned orbital debris mitigation plan. SpaceX, for example, states that once the government adopts verifiable requirements, the government should tie its rules to a rigorous enforcement framework that penalizes the generation of debris and reflects the seriousness of the harm such debris inflicts.⁶⁴¹ We observe, first, that while anomalous events are unanticipated, there are steps that an operator can take to reduce the probability of anomalous events, including testing, and design redundancies, and second, that with a bond in place tied to successful disposal, an operator may decide to begin end-of-life disposal procedures at an earlier stage if the satellite

⁶³⁷ University Small-Satellite Researchers *Ex Parte* Letter at 3. University Small-Satellite Researchers further suggests that the Commission reject the idea of an indemnification requirement in favor of “cross-waiver and release provisions that are typically included in space treaties.” *Id.* It is not clear what the recommendation here is, and the provisions that University Small-Satellite Researchers cite are in the context of government contracting, where the federal government would be the one indemnifying the other entity. *See id.*

⁶³⁸ Letter from Paul Stoetzer, Executive Vice President, AMSAT and David R. Siddall, Washington Counsel, ARRL, to Marlene H. Dortch, Secretary, FCC (rec. Apr. 9, 2020).

⁶³⁹ *See, e.g.*, ORBCOMM Comments at 19-20; Eutelsat Reply at 3-4. Eutelsat, for example, suggests that the costs for GSO satellites would outweigh the benefits. *Id.*

⁶⁴⁰ Eutelsat Reply at 4; *see also* ORBCOMM Comments at 19-20.

⁶⁴¹ SpaceX Comments at 12.

begins experiencing technical issues. We seek comment, however, on how to address situations where there may be a satellite anomaly or the disposal plan changes for reasons outside of an operator's control. We also observe that further developing the record could contribute to further conversations about how to fund future efforts toward active debris removal.⁶⁴² We seek comment on these potential benefits and on generally whether a post-mission disposal bond could help to ensure that operators comply with orbital debris mitigation best practices.

195. Additionally, we seek comment on the impact of a disposal bond on U.S. licensing of satellite systems and U.S. satellite industry innovation, including innovation by smaller providers, entrepreneurs, and new entrants to the satellite industry. We recognize that there may be complexities in structuring a bond that would cover satellite end-of-life, and that maintaining a bond over a longer period of time than is required our current bond regime could potentially result in increased costs to licensees. We seek comment. A disposal bond may need to be maintained for 15 years or longer, depending on the specific disposal plans for the satellite or system, and we seek comment on whether there are ways of structuring a bond requirement to reduce costs to licensees. Are there different issues that need to be considered with a longer time period? What happens if the ownership of the satellite/license changes over time? Although a performance bond tailored to this scenario may not currently exist, we also seek comment on whether a Commission rule could help to drive the market toward the creation of an appropriate bond instrument that would allow operators to satisfy this rule. Additionally, we seek comment on what other countries doing to ensure post-mission disposal. Would adoption of a bond requirement encourage entities to seek licenses outside the United States?

196. In addition to the orbital debris mitigation plan submitted by operators at the application-stage, there are a number of decisions by operators during and after the spacecraft mission which should be made in alignment with orbital debris mitigation best practices and culminate in successful disposal of the spacecraft. Are application-stage requirements sufficient in all cases to incentivize operators to make decisions consistent with orbital debris mitigation best practices throughout the mission and post-mission lifetime of the spacecraft? We seek comment on whether a performance bond can help to ensure post-mission disposal satellite reliability in instances where it may be difficult to assess, for example, where the operator's application-stage demonstration includes ensuring reliability through extensive testing of its satellites. Would a performance bond be another way to ensure the accuracy of the licensee's reliability estimate for post-mission disposal and to further discourage deployments that would potentially result in negative long-term impacts to the orbital environment? Should a potential bond requirement apply to both NGSO and GSO satellite licensees?

197. We also seek comment on some basic implementation issues that would be associated with a disposal bond requirement, such as the question of what constitutes a successful disposal. For NGSO systems, what factors would be considered in determining an appropriate upfront amount for the bond? To what extent would factors such as satellite mass, number of satellites, expected orbital lifetime of a failed satellite, or collision probability of a failed satellite over time be considered, and how would those factors be weighted?⁶⁴³ Taking into consideration both the costs to licensees of a full or partially

⁶⁴² The viability of forfeited performance bonds as a source of funding for active cleanup of debris in orbit is outside the scope of this proceeding. *See, e.g.*, ORBCOMM Comments at 20 (stating that it is not clear if the Commission could ever establish a program to use forfeited de-orbit bonds to pay for the retrieval of spacecraft that were not successfully de-orbited); Sirius XM Comments at 10 (stating that fees obtained from penalizing rogue operators could be used to fund debris removal efforts); Satellite DFR Comments at 4 (the Commission or other regulatory entity should develop and fund a comprehensive program to begin removing debris from Earth orbit); Secure World Foundation Comments at 9 (stating that the removal of debris will need to be funded by governments—and stating that a government-supported technology development program, coupled with government purchase of service contracts, is the best way to develop this capability).

⁶⁴³ As one example, a surety bond could be calculated through a formula that takes into account the mean number of years on orbit for a potential failed satellite, the mean satellite mass, and the total number of satellites in the system. Such a formula could also take into account the collision probability of failed satellites over time.

forfeited bond and the costs to future space operations associated with having failed satellites remain on orbit, what is a reasonable amount for a surety bond for an NGSO system? As one example, we seek comment on the following formula, where the forfeited amount would be based upon any undisposed objects remaining in orbit and undisposed at the conclusion of the license term, beyond those accounted for in the licensee's calculation of the probability of successful disposal. The amount of the bond would also take into consideration the mass of the objects and the number of years that an individual undisposed satellite would remain in orbit longer than 25 years, up to a maximum of 200 years per object. We seek comment on this approach generally, and welcome comment on any alternatives to the specifics of this proposal. For the actual forfeited bond calculation for NGSO licensees, the amount could be calculated as follows:

$$FA = ((M-EM) * ((Y-25)*(O-EO)))$$

Where FA is the forfeited amount to be paid in dollars, M is the total undisposed mass in orbit in kilograms, EM is the expected undisposed mass in orbit in kilograms, and Y is the mean of the remaining years in orbit for any individual undisposed object, up to a maximum of 200 years per object, O is the total number of undisposed objects in orbit, and EO is the expected number of undisposed objects in orbit. The result would be rounded to the nearest \$10,000. We observe that this formulation would result in a forfeited bond of zero for any space station or system deploying into an orbit in which, using conservative projections for solar activity, atmospheric drag will limit the spacecraft's time in orbit to 25 years or less. In this example, therefore, licensees of space stations fitting this description would not be required to post a surety bond. We seek comment. In addition, we seek comment on whether we should provide an exemption from the requirement to post a bond where the maximum forfeited bond under this formula or a different formulation would be less than a certain amount, for example, \$10,000. We observe that the bond in this example would be most significant for those NGSO systems consisting of a large mass and which would have satellites remaining in orbit for a significant number of years beyond 25 years in the event of a failure. We also seek comment on whether we should incorporate the collision probability of the failed satellites over time, with a higher collision probability resulting in a higher forfeited bond.

198. Continuing with the example above, the initial surety bond for NGSO licensees could be calculated as follows:

$$BA = (TM)*((Y-25)(TO))$$

Where BA is the amount of the bond in dollars, TM = the total mass of the satellite system, Y = number of years that an individual satellite will remain in orbit if it fails in the deployment orbit, and TO = total number of objects in orbit. The bond amount (BA) could also be capped, for example, at a maximum of \$100,000,000 for any system. We seek comment on this formula, including, whether certain variables should be modified to incorporate different factors such as individual satellite mass, as well as on the potential monetary amounts and whether those amounts are sufficient to provide an economic incentive for operators.

199. As a simpler alternative for NGSO systems, default could be based upon the failure to dispose according to the expected disposal reliability, or failure to dispose according to the expected disposal reliability taking into consideration satellite mass. Under this alternative, a licensee would post a bond of \$10,000,000, for example, and forfeit the bond if the disposal did not satisfy the disposal reliability metric stated in the application. The amount of the initial bond could vary depending on factors such as mass, number of spacecraft, and number of years in orbit. What costs on both sides should be taken into account when determining a reasonable amount? Is, for example, \$20,000 per satellite reasonable if the satellite is deployed to an orbit where it will remain for thousands of years? Should a bond be most significant for those NGSO systems consisting of a large mass and which would have satellites remaining in orbit for a significant number of years beyond 25 years in the event of a failure? We seek comment on these various alternatives, and on whether there is another approach that would incentivize NGSO operators to achieve high disposal reliability.

200. If a bond were applied to GSO licensees, a successful disposal could be based on disposal in accordance with section 25.283(a) of the Commission's rules within a certain period of time following the conclusion of operations, such as six months following the conclusion of operations.⁶⁴⁴ We seek comment on defining successful disposal for purposes of a GSO disposal bond. As one example, the bond could be forfeited based upon the length of time the space station was in orbit before it was determined that disposal could not be successfully completed. Under this approach, the longer the space station is maintained on-orbit before the attempted disposal or anomaly causing inability to dispose of the spacecraft, the higher the amount of the bond forfeited. We observe that the longer that a GSO space station operates, generally the more susceptible that space station is to malfunction that could put successful disposal at risk. This example would take into consideration this observation, and the amount to be forfeited in the event of a failed disposal would be determined according to the following formula:

$$FA = \$5,000,000*(Y)$$

Where FA is the amount to be paid in dollars, and Y is calculated as follows: if the satellite operates for less than 15 years then Y=1; if the satellite operates between 15 and 20 years, then Y=2; and if the satellite operates for more than 20 years, then Y= two plus the total number of operational years, minus 20. We seek comment.

201. As part of the above example, a GSO licensee could be required to post an initial surety bond, in the amount of, for example, \$5,000,000. For each license extension thereafter, the GSO licensee would then increase the bond in an amount that would cover the additional five-year term, up to the maximum that would be forfeited if the satellite operates for that full five-year term.⁶⁴⁵ In other words, if the operator seeks a five-year extension of the license, from 15 to 20 years, then the operator would increase the bond amount by an additional \$5,000,000. We seek comment on this specific example, and on the concept of an increasing bond with successive license extensions. We also seek comment on the monetary amounts involved and whether those amounts, or alternative amounts would be sufficient to provide an economic incentive for operators. What are the factors that we should consider in setting a bond amount and structuring the bond for GSO licensees? Is there evidence to justify, for example, doubling the bond for extending a GSO satellite's license beyond 15 years or similarly, to support significant increases for each year beyond 20 years? As a simpler alternative, default could be based on whether or not the GSO licensee successfully disposed of the space station, with a single bond amount, \$10,000,000 dollars, for example, due if the space station is not disposed of in accordance with the Commission's rules. We seek comments on these various alternatives, on the appropriate bond amount, and whether there is another approach that would incentivize GSO operators to achieve high disposal reliability.

202. We also seek comment on whether we should consider any other factors with respect to a failed disposal, such as failure to fully vent pressurized vessels, or failure to perform a targeted, controlled reentry into Earth's atmosphere. Additionally, we seek comment on the timing of a bond requirement, if one were to be adopted. For example, would it be reasonable to require licensees to post a surety bond related to post-mission disposal within 30 days following grant of their license? Or, would we require the operators to post a surety bond closer to the date of launch, for example, 90 days prior to launch? We further seek comment on how and when the Commission could make a determination that either the disposal was successful and the bond may be released or that the licensee would need to forfeit a certain amount. For example, should operators file a statement with the Commission specifying the details of the disposal, including those details relevant to determining whether the disposal was successful and to what extent?

⁶⁴⁴ Section 25.283(a) of the Commission's rules specifies a standard formula for GSO space stations to calculate the orbit to which the space stations must be located at the end of the space station's useful life. 47 CFR § 25.283(a).

⁶⁴⁵ Different increases in the bond amount for license extensions shorter than five years could also be considered.

203. Additionally, we seek comment on whether a bond should apply to grantees of U.S. market access. We observe that the post-mission disposal may be addressed in some instances by a different administration, and thus the post-mission disposal bond may overlap with existing requirements in this instance. If such a requirement did not apply to market access grantees, how would this impact U.S. operators? If such a requirement were to apply to both market access grantees and U.S.-licensed systems, how would this impact the availability of satellites services in the United States?

204. Under the NGSO example above referencing a specific formula, small-scale systems, including but not limited to those authorized under the experimental, amateur, or part 25 streamlined small satellite process are unlikely to need to post a bond, both because we would expect a typically small number of satellites in a particular system and because the deployment orbit for those types of missions often results in the spacecraft re-entering within 25 years as a result of atmospheric drag. We seek comment on whether we would still apply the bond to NGSO systems authorized under either an experimental or amateur authorization, and on whether a categorical exemption would be necessary for small systems licensed under part 25, such as under the NGSO streamlined small satellite process, since under certain formulations, those types of licensees would typically not be required to post a disposal bond as practical matter. Alternatively, if we adopt a simplified type of approach for NGSO systems that relies on the licensee meeting the disposal reliability metric indicated in the application, for example, we seek comment on the applicability of that alternative approach to experimental, amateur, or small-scale systems such as those that would be authorized through the part 25 streamlined small satellite process.

205. Finally, we seek comment on whether there are alternative approaches to a bond that should be considered, such as a corporate guarantee, and on the pros and cons of such alternative approaches.

V. PROCEDURAL MATTERS

206. *Ex Parte Procedures.* The proceeding this Further Notice initiates shall be treated as a “permit-but-disclose” proceeding in accordance with the Commission’s *ex parte* rules.⁶⁴⁶ Persons making *ex parte* presentations must file a copy of any written presentation or a memorandum summarizing any oral presentation within two business days after the presentation (unless a different deadline applicable to the Sunshine period applies). Persons making oral *ex parte* presentations are reminded that memoranda summarizing the presentation must (1) list all persons attending or otherwise participating in the meeting at which the *ex parte* presentation was made, and (2) summarize all data presented and arguments made during the presentation. If the presentation consisted in whole or in part of the presentation of data or arguments already reflected in the presenter’s written comments, memoranda or other filings in the proceeding, the presenter may provide citations to such data or arguments in his or her prior comments, memoranda, or other filings (specifying the relevant page and/or paragraph numbers where such data or arguments can be found) in lieu of summarizing them in the memorandum. Documents shown or given to Commission staff during *ex parte* meetings are deemed to be written *ex parte* presentations and must be filed consistent with section 1.1206(b). In proceedings governed by section 1.49(f) or for which the Commission has made available a method of electronic filing, written *ex parte* presentations and memoranda summarizing oral *ex parte* presentations, and all attachments thereto, must be filed through the electronic comment filing system available for that proceeding, and must be filed in their native format (*e.g.*, .doc, .xml, .ppt, searchable .pdf). Participants in this proceeding should familiarize themselves with the Commission’s *ex parte* rules.

207. *Comment Filing Requirements.* Pursuant to sections 1.415 and 1.419 of the Commission’s rules, 47 CFR §§ 1.415, 1.419, interested parties may file comments and reply comments on or before the dates indicated on the first page of this document. Comments may be filed using the Commission’s Electronic Comment Filing System (ECFS). See *Electronic Filing of Documents in Rulemaking Proceedings*, 63 FR 24121 (1998).

⁶⁴⁶ 47 CFR §§ 1.1200 *et seq.*

- *Electronic Filers.* Comments may be filed electronically using the Internet by accessing the ECFS: <http://apps.fcc.gov/ecfs>.
- *Paper Filers.* Parties who choose to file by paper must file an original and one copy of each filing. If more than one docket or rulemaking number appears in the caption of this proceeding, filers must submit two additional copies for each additional docket or rulemaking number.

Filings can be sent by commercial overnight courier, or by first-class or overnight U.S. Postal Service mail. All filings must be addressed to the Commission's Secretary, Office of the Secretary, Federal Communications Commission.

- Commercial overnight mail (other than U.S. Postal Service Express Mail and Priority Mail) must be sent to 9050 Junction Drive, Annapolis Junction, MD 20701. U.S. Postal Service first-class, Express, and Priority mail must be addressed to 445 12th Street, SW, Washington DC 20554.
- Effective March 19, 2020, and until further notice, the Commission no longer accepts any hand or messenger delivered filings. This is a temporary measure taken to help protect the health and safety of individuals, and to mitigate the transmission of COVID-19. See FCC Announces Closure of FCC Headquarters Open Window and Change in Hand-Delivery Policy, Public Notice, DA 20-304 (March 19, 2020). <https://www.fcc.gov/document/fcc-closes-headquarters-open-window-and-changes-hand-delivery-policy>
- *People with Disabilities:* To request materials in accessible formats for people with disabilities (braille, large print, electronic files, audio format), send an email to fcc504@fcc.gov or call the Consumer & Governmental Affairs Bureau at 202-418-0530 (voice) or 202-418-0432 (TTY).

208. *Regulatory Flexibility Act.* Pursuant to the Regulatory Flexibility Act of 1980, as amended, 5 U.S.C. § 601 *et seq.* (RFA), the Commission's Final Regulatory Flexibility Analysis (FRFA) in this Report and Order is attached as Appendix B.

209. *Initial Regulatory Flexibility Analysis.* As required by the Regulatory Flexibility Act of 1980, as amended, the Commission has prepared an Initial Regulatory Flexibility Analysis (IRFA) for this Further Notice, of the possible significant economic impact on small entities of the policies and rules addressed in this document. The IRFA is set forth as Appendix E. Written public comments are requested on this IRFA. Comments must be identified as responses to the IRFA and must be filed by the deadlines for comments on the Notice provided on or before the dates indicated on the first page of this Notice. The Commission's Consumer and Governmental Affairs Bureau, Reference Information Center, will send a copy of the Further Notice, including this IRFA, to the Chief Counsel for Advocacy of the Small Business Administration.

210. *Paperwork Reduction Act.* This document contains modified information collection requirements subject to the Paperwork Reduction Act of 1995 (PRA), Public Law 104-13. It will be submitted to the Office of Management and Budget (OMB) for review under section 3507(d) of the PRA. OMB, other Federal agencies, and the general public are invited to comment on the modified information collection requirements contained in this document. In addition, we note that pursuant to the Small Business Paperwork Relief Act of 2002, Public Law 107-198, see 44 U.S.C. 3506(c)(4), we previously sought specific comment on how the Commission might further reduce the information collection burden for small business concerns with fewer than 25 employees.

211. In this document, we have assessed the effects of adopting rule revisions related to the mitigation of orbital debris and find that doing so will serve the public interest and is unlikely to directly affect businesses with fewer than 25 employees.

212. In addition, this document contains proposed modified information collection requirements. The Commission, as part of its continuing effort to reduce paperwork burdens, invites the general public and the Office of Management and Budget to comment on the information collection requirements contained in this document, as required by the Paperwork Reduction Act of 1995, Public Law 104-13. In addition, pursuant to the Small Business Paperwork Relief Act of 2002, Public Law 107-198, see 44 U.S.C. 3506(c)(4)), we seek specific comment on how we might further reduce the information collection burden for small business concerns with fewer than 25 employees.

213. *Congressional Review Act.*— The Commission has determined, and the Administrator of the Office of Information and Regulatory Affairs, Office of Management and Budget, concurs that this rule is non-major under the Congressional Review Act, 5 U.S.C. § 804(2). The Commission will send a copy of this Report and Order and Further Notice of Proposed Rulemaking to Congress and the Government Accountability Office pursuant to 5 U.S.C. § 801(a)(1)(A).

VI. ORDERING CLAUSES

214. IT IS ORDERED, pursuant to sections 1, 4(i), 301, 303, 307, 308, 309, and 310 of the Communications Act of 1934, as amended, 47 U.S.C. §§ 151, 154(i), 301, 303, 307, 308, 309, and 310, that this Report and Order IS ADOPTED, the policies, rules, and requirements discussed herein ARE ADOPTED, parts 5, 25, and 97 of the Commission's rules ARE AMENDED as set forth in Appendix A, and this Further Notice of Proposed Rulemaking IS ADOPTED.

215. IT IS FURTHER ORDERED that the amendments of the Commission's rules to sections 25.271(d) and 25.282, 47 CFR §§ 25.271(d), 25.282, set forth in Appendix A, ARE ADOPTED, effective thirty days from the date of publication in the Federal Register. The other amendments to the Commission's rules set forth in Appendix A contain new or modified information collection requirements that require review and approval by the Office of Management and Budget under the Paperwork Reduction Act, and WILL BECOME EFFECTIVE after the Commission publishes a notice in the Federal Register announcing such approval and the relevant effective date.

216. IT IS FURTHER ORDERED that the Commission's Consumer and Governmental Affairs Bureau, Reference Information Center, SHALL SEND a copy of this Report and Order and Further Notice of Proposed Rulemaking, including the Initial and Final Regulatory Flexibility Analyses, to the Chief Counsel for Advocacy of the Small Business Administration.

217. IT IS FURTHER ORDERED that the Commission SHALL SEND a copy of this Report and Order in a report to be sent to Congress and the Government Accountability Office pursuant to the Congressional Review Act, see 5 U.S.C. § 801(a)(1)(A).

FEDERAL COMMUNICATIONS COMMISSION

Marlene H. Dortch
Secretary

APPENDIX A
FINAL RULES

The Federal Communications Commission amends title 47 of the Code of Federal Regulations, parts 5, 25, and 97, as follows:

PART 5 – EXPERIMENTAL RADIO SERVICE

1. The authority citation for Part 5 continues to read as follows:

Authority: 47 U.S.C. 154, 301, 302, 303, 307, 336.

2. Amend § 5.64, by revising paragraph (b) to read as follows:

§ 5.64 Special provisions for satellite systems.

* * * * *

(b) Except where the satellite system has already been authorized by the FCC, applicants for an experimental authorization involving a satellite system must submit a description of the design and operational strategies the satellite system will use to mitigate orbital debris, including the following information:

(1) A statement that the space station operator has assessed and limited the amount of debris released in a planned manner during normal operations. Where applicable, this statement must include an orbital debris mitigation disclosure for any separate deployment devices, distinct from the space station launch vehicle, that may become a source of orbital debris;

(2) A statement indicating whether the space station operator has assessed and limited the probability that the space station(s) will become a source of debris by collision with small debris or meteoroids that would cause loss of control and prevent disposal. The statement must indicate whether this probability for an individual space station is 0.01 (1 in 100) or less, as calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool;

(3) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that debris generation will not result from the conversion of energy sources on board the spacecraft into energy that fragments the spacecraft. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

(4) A statement that the space station operator has assessed and limited the probability of the space station(s) becoming a source of debris by collisions with large debris or other operational space stations.

(i) Where the application is for an NGSO space station or system, the following information must also be included:

(A) A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases, to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects.

(B) The statement must identify characteristics of the space station(s)' orbits that may present a collision risk, including any planned and/or operational space stations in those orbits, and indicate what steps, if any, have been taken to coordinate with the other spacecraft or system, or what other measures the operator plans to use to avoid collision.

(C) If at any time during the space station(s)' mission or de-orbit phase the space station(s) will transit through the orbits used by any inhabitable spacecraft, including the International Space Station, the statement must describe the design and operational strategies, if any, that will be used to minimize the risk of collision and avoid posing any operational constraints to the inhabitable spacecraft.

(D) The statement must disclose the accuracy, if any, with which orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system will not maintain orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact should be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems must describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system.

(E) The space station operator must certify that upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations.

(ii) Where a space station requests the assignment of a geostationary orbit location, it must assess whether there are any known satellites located at, or reasonably expected to be located at, the requested orbital location, or assigned in the vicinity of that location, such that the station keeping volumes of the respective satellites might overlap or touch. If so, the statement must include a statement as to the identities of those parties and the measures that will be taken to prevent collisions.

(5) A statement addressing the trackability of the space station(s). Space station(s) operating in low-Earth orbit will be presumed trackable if each individual space station is 10 cm or larger in its smallest dimension, exclusive of deployable components. Where the application is for an NGSO space station or system, the statement shall also disclose the following:

-
- (i) How the operator plans to identify the space station(s) following deployment and whether space station tracking will be active or passive;
 - (ii) Whether, prior to deployment, the space station(s) will be registered with the 18th Space Control Squadron or successor entity; and
 - (iii) The extent to which the space station operator plans to share information regarding initial deployment, ephemeris, and/or planned maneuvers with the 18th Space Control Squadron or successor entity, other entities that engage in space situational awareness or space traffic management functions, and/or other operators.
- (6) A statement disclosing planned proximity operations, if any, and addressing debris generation that will or may result from the proposed operations, including any planned release of debris, the risk of accidental explosions, the risk of accidental collision, and measures taken to mitigate those risks.
- (7) A statement detailing the disposal plans for the space station, including the quantity of fuel—if any—that will be reserved for disposal maneuvers. In addition, the following specific provisions apply:
- (i) For geostationary orbit space stations, the statement must disclose the altitude selected for a disposal orbit and the calculations that are used in deriving the disposal altitude.
 - (ii) For space stations terminating operations in an orbit in or passing through the low-Earth orbit region below 2,000 km altitude, the statement must disclose whether the spacecraft will be disposed of either through atmospheric re-entry, specifying if direct retrieval of the spacecraft will be used. The statement must also disclose the expected time in orbit for the space station following the completion of the mission.
 - (iii) For space stations not covered by either (i) or (ii), the statement must indicate whether disposal will involve use of a storage orbit or long-term atmospheric re-entry and rationale for the selected disposal plan.
 - (iv) For all NGSO space stations under (ii) or (iii), the following additional specific provisions apply:
 - (A) The statement must include a demonstration that the probability of success of the chosen disposal method will be 0.9 or greater for any individual space station. For space station systems consisting of multiple space stations, the demonstration should include additional information regarding efforts to achieve a higher probability of success, with a goal, for large systems, of a probability of success for any individual space station of 0.99 or better. For space stations under (ii) that will be terminating operations in or passing through low-Earth orbit, successful disposal is defined as atmospheric re-entry of the spacecraft within 25 years or less following completion of the mission. For space stations under (iii), successful disposal will be assessed on a case-by-case basis.
 - (B) If planned disposal is by atmospheric re-entry, the statement must also include:
 1. A disclosure indicating whether the atmospheric re-entry will be an uncontrolled re-entry or a controlled targeted reentry.
 2. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth

with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000).

PART 25 – SATELLITE COMMUNICATIONS

1. The authority citation for Part 25 continues to read as follows:

Authority: 47 U.S.C. 154, 301, 302, 303, 307, 309, 310, 319, 332, 605, and 721, unless otherwise noted.

2. Amend § 25.114 by revising paragraph (d)(14) to read as follows:

§ 25.114 Applications for space station authorizations.

* * * * *

(d) * * *

(14) A description of the design and operational strategies that will be used to mitigate orbital debris, including the following information:

(i) A statement that the space station operator has assessed and limited the amount of debris released in a planned manner during normal operations. Where applicable, this statement must include an orbital debris mitigation disclosure for any separate deployment devices, distinct from the space station launch vehicle, that may become a source of orbital debris;

(ii) A statement indicating whether the space station operator has assessed and limited the probability that the space station(s) will become a source of debris by collision with small debris or meteoroids that would cause loss of control and prevent disposal. The statement must indicate whether this probability for an individual space station is 0.01 (1 in 100) or less, as calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool;

(iii) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that debris generation will not result from the conversion of energy sources on board the spacecraft into energy that fragments the spacecraft. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

(iv) A statement that the space station operator has assessed and limited the probability of the space station(s) becoming a source of debris by collisions with large debris or other operational space stations.

(A) Where the application is for an NGSO space station or system, the following information must also be included:

1. A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases, to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects.
2. The statement must identify characteristics of the space station(s)' orbits that may present a collision risk, including any planned and/or operational space stations in those orbits, and indicate what steps, if any, have been taken to coordinate with the other spacecraft or system, or what other measures the operator plans to use to avoid collision.
3. If at any time during the space station(s)' mission or de-orbit phase the space station(s) will transit through the orbits used by any inhabitable spacecraft, including the International Space Station, the statement must describe the design and operational strategies, if any, that will be used to minimize the risk of collision and avoid posing any operational constraints to the inhabitable spacecraft.
4. The statement must disclose the accuracy, if any, with which orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system is not able to maintain orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact must be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems must describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system.
5. The space station operator must certify that upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations.

(B) Where a space station requests the assignment of a geostationary orbit location, it must assess whether there are any known satellites located at, or reasonably expected to be located at, the requested orbital location, or assigned in the vicinity of that location, such that the station keeping volumes of the respective satellites might overlap or touch. If so, the statement must include a statement as to the identities of those satellites and the measures that will be taken to prevent collisions;

(v) A statement addressing the trackability of the space station(s). Space station(s) operating in low-Earth orbit will be presumed trackable if each individual space station is 10 cm or larger in its smallest dimension, excluding deployable components. Where the application is for an NGSO space station or system, the statement shall also disclose the following:

(A) How the operator plans to identify the space station(s) following deployment and whether space station tracking will be active or passive;

(B) Whether, prior to deployment, the space station(s) will be registered with the 18th Space Control Squadron or successor entity; and

(C) The extent to which the space station operator plans to share information regarding initial deployment, ephemeris, and/or planned maneuvers with the 18th Space Control Squadron or successor entity, other entities that engage in space situational awareness or space traffic management functions, and/or other operators.

(vi) A statement disclosing planned proximity operations, if any, and addressing debris generation that will or may result from the proposed operations, including any planned release of debris, the risk of accidental explosions, the risk of accidental collision, and measures taken to mitigate those risks.

(vii) A statement detailing the disposal plans for the space station, including the quantity of fuel—if any—that will be reserved for disposal maneuvers. In addition, the following specific provisions apply:

(A) For geostationary orbit space stations, the statement must disclose the altitude selected for a disposal orbit and the calculations that are used in deriving the disposal altitude.

(B) For space stations terminating operations in an orbit in or passing through the low-Earth orbit region below 2,000 km altitude, the statement must disclose whether the spacecraft will be disposed of through atmospheric re-entry, specifying if direct retrieval of the spacecraft will be used. The statement must also disclose the expected time in orbit for the space station following the completion of the mission.

(C) For space stations not covered by either (A) or (B), the statement must indicate whether disposal will involve use of a storage orbit or long-term atmospheric re-entry and rationale for the selected disposal plan.

(D) For all space stations under (B) or (C), the following additional specific provisions apply:

1. The statement must include a demonstration that the probability of success of the chosen disposal method will be 0.9 or greater for any individual space station. For space station systems consisting of multiple space stations, the demonstration should include additional information regarding efforts to achieve a higher probability of success, with a goal, for large systems, of a probability of success for any individual space station of 0.99 or better. For space stations under (B), successful disposal is defined as

atmospheric re-entry of the spacecraft within 25 years or less following completion of the mission. For space stations under (C), successful disposal will be assessed on a case-by-case basis.

2. If planned disposal is by atmospheric re-entry, the statement must also include:

a. A disclosure indicating whether the atmospheric re-entry will be an uncontrolled re-entry or a controlled targeted reentry.

b. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000).

(E) Applicants for space stations to be used only for commercial remote sensing may, in lieu of submitting detailed post-mission disposal plans to the Commission, certify that they have submitted such plans to the National Oceanic and Atmospheric Administration for review.

(viii) For non-U.S.-licensed space stations, the requirement to describe the design and operational strategies to minimize orbital debris risk can be satisfied by demonstrating that debris mitigation plans for the space station(s) for which U.S. market access is requested are subject to direct and effective regulatory oversight by the national licensing authority.

* * * * *

3. Amend § 25.121 to add paragraph (f) as follows:

§25.121 License term and renewals.

* * * * *

(f) *Geostationary Satellite License Term Extensions.*

(1) For geostationary space stations issued an initial license term for a period of 15 years, licensees may apply for a modification to extend the license term in increments of five years or less.

(2) Geostationary space station licensees seeking a license term extension through a license modification application must provide a statement that includes the following:

(i) The requested duration of the license extension;

(ii) The estimated total remaining space station lifetime;

(iii) A description of any single points of failure or other malfunctions, defects, or anomalies during the space station operation that could affect its ability to conduct end-of-life procedures as planned, and an assessment of the associated risk;

(iv) A certification that remaining fuel reserves are adequate to complete de-orbit as planned; and

(v) A certification that telemetry, tracking, and command links are fully functional.

4. Amend § 25.122 by revising paragraphs (c) and (d) to read as follows:

§ 25.122 Applications for streamlined small space station authorization.

* * * * *

(c) *Certifications under this section.* Applicants filing for authorization under the streamlined procedure described in this section must include with their applications certifications that the following criteria will be met for all space stations to be operated under the license:

- (1) The space station(s) will operate only in non-geostationary orbit;
- (2) The total in-orbit lifetime for any individual space station will be six years or less;
- (3) The space station(s):
 - (i) Will be deployed at an orbital altitude of 600 km or below; or
 - (ii) Will maintain a propulsion system and have the ability to make collision avoidance and deorbit maneuvers using propulsion.
- (4) Each space station will be identifiable by a unique signal-based telemetry marker distinguishing it from other space stations or space objects;
- (5) The space station(s) will release no operational debris;
- (6) The space station operator has assessed and limited the probability of accidental explosions, including those resulting from the conversion of energy sources on board the space station(s) into energy that fragments the spacecraft;
- (7) The probability of a collision between each space station and any other large object (10 centimeters or larger) during the orbital lifetime of the space station is 0.001 or less as calculated using current NASA software or other higher fidelity model;
- (8) The space station(s) will be disposed of post-mission through atmospheric re-entry. The probability of human casualty from portions of the spacecraft surviving re-entry and reaching the surface of the Earth is zero as calculated using current NASA software or higher fidelity models;
- (9) Operation of the space station(s) will be compatible with existing operations in the authorized frequency band(s). Operations will not materially constrain future space station entrants from using the authorized frequency band(s);
- (10) The space station(s) can be commanded by command originating from the ground to immediately cease transmissions and the licensee will have the capability to eliminate harmful interference when required under the terms of the license or other applicable regulations;

- (11) Each space station is 10 cm or larger in its smallest dimension;
- (12) Each space station will have a mass of 180 kg or less, including any propellant;
- (13) The probability that any individual space station will become a source of debris by collision with small debris or meteoroids that would cause loss of control and prevent disposal is 0.01 (1 in 100) or less; and
- (14) Upon receipt of a space situational awareness conjunction warning, the licensee or operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations.

(d) *Other application information.* The following information in narrative form shall be contained in each application:

- (1) An overall description of system facilities, operations, and services and an explanation of how uplink frequency bands would be connected to downlink frequency bands;
- (2) Public interest considerations in support of grant;
- (3) A description of means by which requested spectrum could be shared with both current and future operators, (e.g., how ephemeris data will be shared, antenna design, earth station geographic locations) thereby not materially constraining other operations in the requested frequency band(s);
- (4) If at any time during the space station(s)' mission or de-orbit phase the space station(s) will transit through the orbits used by any inhabitable spacecraft, including the International Space Station, a description of the design and operational strategies, if any, that will be used to minimize the risk of collision and avoid posing any operational constraints to the inhabitable spacecraft shall be furnished at the time of application;
- (5) A statement identifying characteristics of the space station(s)' orbits that may present a collision risk, including any planned and/or operational space stations in those orbits, and indicating what steps, if any, have been taken to coordinate with the other spacecraft or system, or what other measures the licensee plans to use to avoid collision;
- (6) A statement disclosing how the licensee or operator plans to identify the space station(s) following deployment and whether space station tracking will be active or passive; whether the space station(s) will be registered with the 18th Space Control Squadron or successor entity prior to deployment; and the extent to which the space station licensee or operator plans to share information regarding initial deployment, ephemeris, and/or planned maneuvers with the 18th Space Control Squadron or successor entity, other entities that engage in space situational awareness or space traffic management functions, and/or other operators;
- (7) A description of the design and operation of maneuverability and deorbit systems, if any, and a description of the anticipated evolution over time of the orbit of the proposed satellite or satellites;

(8) If there are planned proximity operations, a statement disclosing those planned operations, and addressing debris generation that will or may result from the proposed operations, including any planned release of debris, the risk of accidental explosions, the risk of accidental collision, and measures taken to mitigate those risks;

(9) A demonstration that the probability of success of disposal is 0.9 or greater for any individual space station. Space stations deployed to orbits in which atmospheric drag will, in the event of a space station failure, limit the lifetime of the space station to less than 25 years do not need to provide this additional demonstration; and

(10) A list of the FCC file numbers or call signs for any known applications or Commission grants related to the proposed operations (e.g., experimental license grants, other space station or earth station applications or grants).

5. Amend § 25.123 by adding paragraph (b)(11) to read as follows::

§ 25.123 Applications for streamlined small spacecraft authorization.

* * * * *

(b) * * *

* * *

(11) Upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations.

* * * * *

6. Amend § 25.271 by revising paragraphs (d) to read as follows:

§ 25.271 Control of transmitting stations.

(d) The licensee shall ensure that the licensed facilities are properly secured against unauthorized access or use whenever an operator is not present at the transmitter. For space station operations, this includes securing satellite commands against unauthorized access and use.

7. Amend § 25.282 by modifying, by revising paragraph (b) to read as follows:

§ 25.282 Orbit raising maneuvers.

* * * * *

(b) The space station operator will coordinate on an operator-to-operator basis with any potentially affected satellite networks.

* * *

PART 97 – AMATEUR RADIO SERVICE

1. The authority citation for Part 97 continues to read as follows:

Authority: 47 U.S.C. 151-155, 301-609, unless otherwise noted.

2. Amend § 97.207 by revising paragraph (g)(1) to read as follows:

§ 97.207 Space station.

* * * * *

(g) * * *

(1) A pre-space notification within 30 days after the date of launch vehicle determination, but no later than 90 days before integration of the space station into the launch vehicle. The notification must be in accordance with the provisions of Articles 9 and 11 of the International Telecommunication Union (ITU) Radio Regulations and must specify the information required by Appendix 4 and Resolution No. 642 of the ITU Radio Regulations. The notification must also include a description of the design and operational strategies that the space station will use to mitigate orbital debris, including the following information:

(i) A statement that the space station operator has assessed and limited the amount of debris released in a planned manner during normal operations. Where applicable, this statement must include an orbital debris mitigation disclosure for any separate deployment devices, distinct from the space station launch vehicle, that may become a source of orbital debris;

(ii) A statement indicating whether the space station operator has assessed and limited the probability that the space station(s) will become a source of debris by collision with small debris or meteoroids that would cause loss of control and prevent disposal. The statement must indicate whether this probability for an individual space station is 0.01 (1 in 100) or less, as calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool;

(iii) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that debris generation will not result from the conversion of energy sources on board the spacecraft into energy that fragments the spacecraft. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

(iv) A statement that the space station operator has assessed and limited the probability of the space station(s) becoming a source of debris by collisions with large debris or other operational space stations.

(A) Where the application is for an NGSO space station or system, the following information must also be included:

(1) A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases,

to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects.

(2) The statement must identify characteristics of the space station(s)' orbits that may present a collision risk, including any planned and/or operational space stations in those orbits, and indicate what steps, if any, have been taken to coordinate with the other spacecraft or system, or what other measures the operator plans to use to avoid collision.

(3) If at any time during the space station(s)' mission or de-orbit phase the space station(s) will transit through the orbits used by any inhabitable spacecraft, including the International Space Station, the statement must describe the design and operational strategies, if any, that will be used to minimize the risk of collision and avoid posing any operational constraints to the inhabitable spacecraft.

(4) The statement must disclose the accuracy, if any, with which orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system is not be maintained to specific orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact should be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems must describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system.

(5) The space station operator must certify that upon receipt of a space situational awareness conjunction warning, the operator will review and take all possible steps to assess the collision risk, and will mitigate the collision risk if necessary. As appropriate, steps to assess and mitigate the collision risk should include, but are not limited to: contacting the operator of any active spacecraft involved in such a warning; sharing ephemeris data and other appropriate operational information with any such operator; and modifying space station attitude and/or operations.

(B) Where a space station requests the assignment of a geostationary orbit location, it must assess whether there are any known satellites located at, or reasonably expected to be located at, the requested orbital location, or assigned in the vicinity of that location, such that the station keeping volumes of the respective satellites might overlap or touch. If so, the statement must include a statement as to the identities of those parties and the measures that will be taken to prevent collisions.

(v) A statement addressing the trackability of the space station(s). Space station(s) operating in low-Earth orbit will be presumed trackable if each individual space station is 10 cm or larger in its smallest dimension, exclusive of deployable components. Where the application is for an NGSO space station or system, the statement shall also disclose the following:

-
- (A) How the operator plans to identify the space station(s) following deployment and whether space station tracking will be active or passive;
- (B) Whether, prior to deployment, the space station(s) will be registered with the 18th Space Control Squadron or successor entity; and
- (C) The extent to which the space station operator plans to share information regarding initial deployment, ephemeris, and/or planned maneuvers with the 18th Space Control Squadron or successor entity, other entities that engage in space situational awareness or space traffic management functions, and/or other operators.
- (vi) A statement disclosing planned proximity operations, if any, and addressing debris generation that will or may result from the proposed operations, including any planned release of debris, the risk of accidental explosions, the risk of accidental collision, and measures taken to mitigate those risks.
- (vii) A statement detailing the disposal plans for the space station, including the quantity of fuel—if any—that will be reserved for disposal maneuvers. In addition, the following specific provisions apply:
- (A) For geostationary orbit space stations, the statement must disclose the altitude selected for a disposal orbit and the calculations that are used in deriving the disposal altitude.
- (B) For space stations terminating operations in an orbit in or passing through the low-Earth orbit region below 2,000 km altitude, the statement must disclose whether the spacecraft will be disposed of either through atmospheric re-entry, specifying if direct retrieval of the spacecraft will be used. The statement must also disclose the expected time in orbit for the space station following the completion of the mission.
- (C) For space stations not covered by either (A) or (B), the statement must indicate whether disposal will involve use of a storage orbit or long-term atmospheric re-entry and rationale for the selected disposal plan.
- (D) For all NGSO space stations under (B) or (C), the following additional specific provisions apply:
- (1) The statement must include a demonstration that the probability of success of the chosen disposal method will be 0.9 or greater for any individual space station. For space station systems consisting of multiple space stations, the demonstration should include additional information regarding efforts to achieve a higher probability of success, with a goal, for large systems, of a probability of success for any individual space station of 0.99 or better. For space stations under (B) that will be terminating operations in or passing through low-Earth orbit, successful disposal is defined as atmospheric re-entry of the spacecraft within 25 years or less following completion of the mission. For space stations under (C), successful disposal will be assessed on a case-by-case basis.
- (2) If planned disposal is by atmospheric re-entry, the statement must also include:

- a. A disclosure indicating whether the atmospheric re-entry will be an uncontrolled re-entry or a controlled targeted reentry.
- b. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000).

(viii) If any material item described in this notification changes before launch, a replacement pre-space notification shall be filed with the International Bureau no later than 90 days before integration of the space station into the launch vehicle.

* * * * *

APPENDIX B

Final Regulatory Flexibility Analysis

As required by the Regulatory Flexibility Act of 1980, as amended (RFA),¹ an Initial Regulatory Flexibility Analysis (IRFA) was incorporated in the Notice of Proposed Rulemaking, *Mitigation of Orbital Debris in the New Space Age (Notice)*, released in November 2018 in this proceeding.² No comments were filed addressing the IRFA. This present Final Regulatory Flexibility Analysis (FRFA) conforms to the RFA.³

A. Need for, and Objectives of, the Proposed Rules

This Order adopts updates to the Commission's rules relating to the mitigation of orbital debris. This represents the first comprehensive update to our rules on orbital debris mitigation since their adoption in 2004. These rule changes are informed by the Commission's experience gained in the licensing process and address updates in mitigation guidelines and practices as well as market developments. Adoption of these rule revisions will ensure that applicants for a Commission space station license or authorization, or grant of market access, provide a complete statement concerning plans for orbital debris mitigation enabling the Commission to fully evaluate whether the proposed operations are consistent with the public interest. Adoption of these rules will also provide specific guidance on evaluation criteria for orbital debris mitigation plans in a number of areas, for both non-geostationary orbit (NGSO) and geostationary-orbit (GSO) space stations. This action will help to ensure that Commission decisions are consistent with the public interest in space remaining viable for future satellites and systems and the many services that those systems provide to the public.

The Order adopts several changes to 47 CFR parts 5, 25, and 97. Principally, it:

- 1) Revises the Commission's application disclosure rules regarding mitigation of orbital debris to incorporate specific metrics for assessments of risk of collision with large objects, risk of collision with small objects, and re-entry casualty risk;
- 2) Adopts application disclosures regarding protection of inhabitable spacecraft, maneuverability trackability, space station identification, and sharing of information regarding initial space station deployment, ephemeris, and/or planned maneuvers;
- 3) Adopts a demonstration requirement for applicants for NGSO space stations that the probability of success of the chosen disposal method is 0.9 or greater for any individual space station, with the demonstration including efforts to achieve a higher probability of success for larger systems;
- 4) Codifies the current practice of requesting certain types of information from GSO licensees requesting license term extensions, and limits most GSO licensees to license extensions in increments of five years; and
- 5) Adopts other rules updates to address specific situations, including proximity operations, use of deployment devices, and certain types of plans for disposal of space stations.

B. Summary of Significant Issues Raised by Public Comments in Response to the IRFA

No comments were filed that specifically addressed the IRFA.

¹ See 5 U.S.C. § 603. The RFA, see 5 U.S.C. § 601-612, has been amended by the Small Business Regulatory Enforcement Fairness Act of 1996, (SBREFA) Pub. L. No. 104-121, Title II, 110 Stat. 857 (1996).

² *Mitigation of Orbital Debris in the New Space Age*, Notice of Proposed Rulemaking, 33 FCC Rcd 11352 (2019).

³ See 5 U.S.C. § 604.

C. Response to Comments by the Chief Counsel for Advocacy of the Small Business Administration

Pursuant to the Small Business Jobs Act of 2010, which amended the RFA, the Commission is required to respond to any comments filed by the Chief Counsel for Advocacy of the Small Business Administration (SBA), and to provide a detailed statement of any change made to the proposed rules as a result of those comments.⁴ The Chief Counsel did not file any comments in response to the proposed rules in this proceeding.

D. Description and Estimate of the Number of Small Entities To Which the Proposed Rules Will Apply

The RFA directs agencies to provide a description of, and, where feasible, an estimate of, the number of small entities that may be affected by the proposed rules and policies, if adopted herein.⁵ The RFA generally defines the term “small entity” as having the same meaning as the terms “small business,” “small organization,” and “small governmental jurisdiction.”⁶ In addition, the term “small business” has the same meaning as the term “small business concern” under the Small Business Act.⁷ A “small business concern” is one which: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any additional criteria established by the Small Business Administration (SBA).⁸ Below, we describe and estimate the number of small entities that may be affected by adoption of the final rules.

Satellite Telecommunications and All Other Telecommunications.

Satellite Telecommunications. This category comprises firms “primarily engaged in providing telecommunications services to other establishments in the telecommunications and broadcasting industries by forwarding and receiving communications signals via a system of satellites or reselling satellite telecommunications.”⁹ Satellite telecommunications service providers include satellite and earth station operators. The category has a small business size standard of \$35 million or less in average annual receipts, under SBA rules.¹⁰ For this category, U.S. Census Bureau data for 2012 show that there were a total of 333 firms that operated for the entire year.¹¹ Of this total, 299 firms had annual receipts of less than \$25 million.¹² Consequently, we estimate that the majority of satellite telecommunications providers are small entities

⁴ 5 U.S.C. § 604(a)(3).

⁵ *Id.*

⁶ 5 U.S.C. § 601(6).

⁷ 5 U.S.C. § 601(3) (incorporating by reference the definition of “small-business concern” in the Small Business Act, 15 U.S.C. § 632). Pursuant to 5 U.S.C. § 601(3), the statutory definition of a small business applies “unless an agency, after consultation with the Office of Advocacy of the Small Business Administration and after opportunity for public comment, establishes one or more definitions of such term which are appropriate to the activities of the agency and publishes such definition(s) in the Federal Register.”

⁸ 15 U.S.C. § 632.

⁹ U.S. Census Bureau, *2017 NAICS Definitions, “517410 Satellite Telecommunications”*; <https://www.census.gov/cgi-bin/sssd/naics/naicsrch?input=517410&search=2017+NAICS+Search&search=2017>.

¹⁰ 13 CFR § 121.201, NAICS code 517410.

¹¹ U.S. Census Bureau, *2012 Economic Census of the United States, Table EC1251SSSZ4, Information: Subject Series - Estab and Firm Size: Receipts Size of Firms for the United States: 2012*, NAICS Code 517410, https://factfinder.census.gov/bkmk/table/1.0/en/ECN/2012_US/51SSSZ4//naics~517410.

¹² *Id.* The available U.S. Census Bureau data does not provide a more precise estimate of the number of firms that meet the SBA size standard of annual receipts of \$35 million or less.

All Other Telecommunications. The “All Other Telecommunications” category is comprised of establishments primarily engaged in providing specialized telecommunications services, such as satellite tracking, communications telemetry, and radar station operation.¹³ This industry also includes establishments primarily engaged in providing satellite terminal stations and associated facilities connected with one or more terrestrial systems and capable of transmitting telecommunications to, and receiving telecommunications from, satellite systems.¹⁴ Establishments providing Internet services or voice over Internet protocol (VoIP) services via client-supplied telecommunications connections are also included in this industry.¹⁵ The SBA has developed a small business size standard for “All Other Telecommunications”, which consists of all such firms with annual receipts of \$35 million or less.¹⁶ For this category, U.S. Census Bureau data for 2012 show that there were 1,442 firms that operated for the entire year.¹⁷ Of those firms, a total of 1,400 had annual receipts less than \$25 million and 15 firms had annual receipts of \$25 million to \$49, 999,999.¹⁸ Thus, the Commission estimates that the majority of “All Other Telecommunications” firms potentially affected by our action can be considered small.

These rule changes would also apply to experimental space station applicants under part 5 and amateur space station operators under part 97, and we estimate that in almost all cases these entities will qualify under the definition of small entities. Additionally, we estimate that some space station applicants applying under part 25 of the Commission’s rules will qualify as small entities affected by these rule changes.

E. Description of the Projected Reporting, Recordkeeping, and Other Compliance Requirements for Small Entities

The Order amended those rules that are applicable to space station operators requesting a license or authorization from the Commission, or entities requesting that the Commission grant a request for U.S. market access. These applicants must submit a debris mitigation plan to the Commission as part of the application process, and the Order revised in part the information to be included in that debris mitigation plan. These revisions codified a number of informational requirements that applicants were providing under the existing rules, including providing some specific metrics for operators to reference in preparing orbital debris mitigation plans. The Order also adopts some additional disclosure requirements related to orbital debris mitigation.

Applicants requesting authorization from the Commission must comply with existing technical disclosure requirements, including those related to orbital debris mitigation. Much of the information covered in the revised rules is information that applicants already provide or that the Commission would currently seek from the applicant under its existing general disclosure requirements. Most applicants already prepare orbital debris mitigation plans using the National Aeronautics and Space Administration (NASA) Debris Assessment Software identified in the revised rules as an acceptable assessment tool. This assessment tool is available at no cost and documentation on how to use the software is made available online by NASA. The additional disclosure and certification requirements adopted in the Report and Order are consistent with the types of legal and technical requirements already specified in the Commission’s application rules, and therefore we expect that all parties, including small entities, will

¹³ See U.S. Census Bureau, *2017 NAICS Definitions*, “517919 All Other Telecommunications”, <https://www.census.gov/cgi-bin/sssd/naics/naicsrch?input=517919&search=2017+NAICS+Search&search=2017>.

¹⁴ *Id.*

¹⁷ U.S. Census Bureau, *2012 Economic Census of the United States*, Table EC1251SSSZ4, *Information: Subject Series - Estab and Firm Size: Receipts Size of Firms for the United States: 2012*, NAICS Code 517919, https://factfinder.census.gov/bkmk/table/1.0/en/ECN/2012_US/51SSSZ4/naics~517919.

¹⁸ *Id.*

have the resources to prepare and disclose orbital debris mitigation plans in accordance with the revised rules.

F. Steps Taken to Minimize the Significant Economic Impact on Small Entities, and Significant Alternatives Considered

The RFA requires an agency to describe any significant alternatives that it has considered in developing its approach, which may include the following four alternatives (among others): “(1) the establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities; (2) the clarification, consolidation, or simplification of compliance and reporting requirements under the rule for such small entities; (3) the use of performance rather than design standards; and (4) an exemption from coverage of the rule, or any part thereof, for such small entities.”¹⁹

(1) *Differing compliance or reporting requirements or timetables.* The Order requires all space station applicants to disclose plans to mitigate orbital debris at the application stage, and thus applicants may prepare and submit the information according to their schedule, so long as the information is part of the application to the Commission, and there is enough time for the Commission to review and act on the application prior to launch. Applicants for GSO license extensions similarly may prepare information in support of their request for an extension in accordance with their preferred timetable. As noted, the revised requirements overall are consistent with the level of technical analysis that applicants currently provide in preparing an application for Commission review. We do make a timetable modification in the amateur space station rules to accommodate the notification process for Part 97 amateur authorizations.²⁰ Applicants for systems consisting of multiple space stations will need to provide some additional information at the application stage, recognizing the impact of a system consisting of multiple satellites on the orbital debris environment. As noted above, operation of multiple space stations is not always correlated with larger entities, however, since small entities may also plan to operate multiple space stations. As a general matter, we observe that space station operations by small entities can pose the same public interest concerns as those posed by large entities when it comes to contribution to the orbital debris environment, with the level of contribution to the debris environment being driven by factors other than the size of the entity.

(2) *Clarification, consolidation, or simplification of compliance or reporting requirements.* The Order clarifies a number of existing compliance requirements by providing specific metrics and guidance in a number of areas that inform an applicant’s disclosures and certifications related to orbital debris mitigation. The Order also clarifies the authorization process by specifying additional disclosures in the rules, thereby providing applicants, including small entities, with a more complete view of the information that the Commission needs during a typical license or authorization process in order to adequately assess the applicant’s orbital debris mitigation plan.

(3) *Use of performance, rather than design, standards.* The Order specifically addresses comments requesting the use of performance, rather than prescriptive, or design, standards.²¹ We have endeavored throughout the Report and Order to adopt a performance-based approach where feasible.

(4) *Exemption from coverage of the rule, or any part thereof, for small entities.* With respect to exemptions, we reiterate our observation that as a general matter, space station operations by small entities can present the same public interest concerns as those posed by large entities when it comes to contribution to the orbital debris environment, with the level of contribution to the debris environment

¹⁹ 5 U.S.C. § 603(c)(1)-(4).

²⁰ Amateur licensee grantees will provide information on orbital debris mitigation to the Commission as part of a pre-space notification no later than 90 days before integration of the space station into the launch vehicle. 47 CFR § 97.207.

²¹ *Order* at para. 13.

being driven by factors other than the size of the entity. Therefore, we do not adopt exemptions from coverage of a rule for small entities.

Report to Congress

The Commission will send a copy of the *Order*, including this FRFA, in a report to Congress pursuant to the Congressional Review Act.²² In addition, the Commission will send a copy of the *Order*, including this FRFA, to the Chief Counsel for Advocacy of the SBA. A copy of the *Order* and FRFA (or summaries thereof) will also be published in the *Federal Register*.²³

²² See 5 U.S.C. § 801(a)(1)(A).

²³ See 5 U.S.C. § 604(b).

APPENDIX D
PROPOSED RULES

The Federal Communications Commission amends title 47 of the Code of Federal Regulations, parts 5, 25, and 97, as follows:

PART 5 – EXPERIMENTAL RADIO SERVICE

1. The authority citation for Part 5 continues to read as follows:

Authority: 47 U.S.C. 154, 301, 302, 303, 307, 336.

2. Amend § 5.64 by revising paragraph (b), and adding paragraph (c), to read as follows:

§ 5.64 Special provisions for satellite systems.

* * * * *

(b) * * *

(3) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that the integrated probability of debris-generating explosions for all credible failure modes of the space station (excluding small particle impacts) is less than 0.001 (1 in 1,000) during deployment and mission operations. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

(4) * * *

(i) Where the application is for an NGSO space station or system, the following information must also be included:

(A) A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases, to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects. For systems consisting of multiple space stations, the statement must also include an assessment of the total probability of collision, calculated as the sum of the probability of collision associated with each individual space station. Where the total probability of collision exceeds 0.001 (1 in 1,000) assuming a 10% failure rate of any maneuvering capability at an orbit that presents the worst case for collision risk, the statement must include an additional demonstration of the expected failure rate of maneuverability, and the orbit where the operator would expect most failures to occur,

and calculate the total probability of failure based on those assumptions.

* * *

(D) The statement must disclose the accuracy, if any, with which orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system will not maintain orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact should be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems should describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system. For space stations deployed into the portion of the low-Earth orbit region above 400 km, the operator must certify that the space stations will be designed with the maneuvering capabilities sufficient to perform effective collision avoidance throughout the period when the space stations are above 400 km.

* * * *

(7) * * *

(iv) * * *

(A) * * *

2. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000). For systems consisting of multiple space stations, the statement must also include an assessment of the total casualty risk associated with the system, calculated as the sum of the casualty risk associated with each individual space station. If this total casualty risk exceeds 0.0001 (1 in 10,000), the statement must also include a description of strategies considered to reduce collision risk, such as designing the satellites with materials more likely to demise upon reentry and/or targeted re-entry, and the extent to which those strategies were incorporated into the mission profile.

(c) Applicants must submit a signed statement stating that upon issuance of a license by the Commission, the licensee will be responsible for indemnifying the United States against any costs associated with a claim brought under a provision of the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies or Convention on International Liability for Damage Caused by Space Objects related to the facilities that are the subject of the license.

PART 25 – SATELLITE COMMUNICATIONS

1. The authority citation for Part 25 continues to read as follows:

Authority: 47 U.S.C. 154, 301, 302, 303, 307, 309, 310, 319, 332, 605, and 721, unless otherwise noted.

2. Amend § 25.114 by revising paragraph (d)(14) by revising to read as follows:

§ 25.114 Applications for space station authorizations.

* * * * *

(d) * * *

(14) * * *

* * *

(iii) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that the integrated probability of debris-generating explosions for all credible failure modes of the space station (excluding small particle impacts) is less than 0.001 (1 in 1,000) during deployment and mission operations. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

* * *

(iv) * * *

(A) Where the application is for an NGSO space station or system, the following information must also be included:

1. A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases, to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects. For systems consisting of multiple space stations, the statement must also include an assessment of the total probability of collision, calculated as the sum of the probability of collision associated with each individual space station. The total estimated number of space stations deployed over a 15-year period, including any replacement space stations, must be used for this calculation. Where the total probability of collision exceeds 0.001 (1 in 1,000) assuming a 10% failure rate of any maneuvering capability at an orbit that presents the worst case for collision risk, the statement must include an additional demonstration of the expected failure rate of maneuverability, and the orbit where the operator would expect most failures to occur, and calculate the total probability of failure based on those assumptions.

* * *

4. The statement must disclose the accuracy, if any, with which

orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system will not maintain orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact should be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems should describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system. For space stations deployed into the portion of the low-Earth orbit region above 400 km, the operator must certify that the space stations will be designed with the maneuvering capabilities sufficient to perform effective collision avoidance throughout the period when the space stations are above 400 km.

* * *

(vii) * * *

(D) * * *

2. * * *

b. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000). For systems consisting of multiple space stations, the statement must also include an assessment of the total casualty risk associated with the system, calculated as the sum of the casualty risk associated with each individual space station. The total estimated number of space stations deployed over a 15-year period, including any replacement space stations, must be used for this calculation. For applications for either a single space station or multiple space stations, where portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, the statement must also include a description of strategies considered to reduce casualty risk, such as use of materials designed to demise upon reentry and/or targeted re-entry, and the extent to which those strategies were incorporated into the mission profile.

* * * *

(viii) Applicants must submit a signed statement stating that the licensee will be responsible for indemnifying the United States against any costs associated with a claim brought under a provision of the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies or Convention on International Liability for Damage Caused by Space Objects related to the facilities that are the subject of the license.

(ix) For non-U.S.-licensed space stations, the requirement to describe the design and operational strategies to minimize orbital debris risk can be satisfied either by submitting the information required of U.S.-licensed space stations, or by demonstrating that debris mitigation plans for the space station(s) for which U.S. market access is requested are subject to direct and effective regulatory oversight by the national licensing authority.

3. Add Section 25.166 to read as follows:

§ 25.166 Surety bonds for successful post-mission disposal.

(a) For all space stations licenses issued after [], the licensee must post a surety bond specific to successful post-mission disposal within 30 days of the grant of its license. Failure to post a bond will render the license null and void automatically.

(1) An NGSO licensee:

(A) Must have on file a surety bond requiring payment in the event of default as defined below in paragraph (B), determined according to the following formula: $BA = (TM) * ((Y - 25)(TO))$. BA is the amount of the bond in dollars, TM is the total mass of the satellite system, Y is the number of years that an individual satellite will remain in orbit if it fails in the deployment orbit, and TO is the total number of objects in orbit. The bond amount (BA) would be capped at a maximum of \$100,000,000 for any system.

(B) Will be considered in default if any undisposed objects remain in orbit and undisposed at the conclusion of the license term, beyond those accounted for in the licensee's calculation of the probability of successful disposal. In the case of default, the NGSO licensee will be responsible for the amount determined according to the following formula, and rounded to the nearest \$10,000. $FA = (M - EM) * ((Y - 25)(O - EO))$. FA is the amount to be paid in dollars, M is the total undisposed mass in orbit in kilograms, EM is the expected undisposed mass in orbit in kilograms, Y is the mean of the remaining years in orbit for any individual undisposed object, up to a maximum of 200 years per object, and O is the total number of undisposed objects in orbit, and EO is the expected number of undisposed objects in orbit.

(2) A GSO licensee:

(A) Must have on file a surety bond requiring payment in the event of default as defined in paragraph (B) of this section in the amount of \$5,000,000. If the licensee is granted a modification to extend the length of its license by up to five years, the surety bond on file must be increased by \$5,000,000, and by an additional \$5,000,000 for a subsequent extension of up to five years. For any additional years of license extension authorized by the Commission, the surety bond on file must be increased to an amount that would satisfy the formula in paragraph (B) of this section.

(B) Will be considered in default if the licensed space station is not disposed of in accordance with the statement specified in §§ 25.114(d)(14)(iv) and 25.283 within 6 months following conclusion of operations. In the case of default, the NGSO licensee will be responsible for the amount determined according to the following formula: $FA = \$5,000,000 * (Y)$, where FA is the amount to be paid in dollars, and Y is calculated as follows: if the satellite operates for less than 15 years then $Y=1$; if the satellite operates between 15 and 20 years, then $Y=2$; and if the satellite operates for more than 20 years, then $Y=$ two plus the total number of operational years,

minus 20.

(b) The licensee must use a surety company deemed acceptable within the meaning of 31 U.S.C. 9304 et seq. (*See, e.g.*, Department of Treasury Fiscal Service, Companies Holding Certificates of Authority as Acceptable Sureties on Federal Bonds and As Acceptable Reinsurance Companies, 57 FR 29356, July 1, 1992.) The bond must name the U.S. Treasury as beneficiary in the event of the licensee's default. The licensee must provide the Commission with a copy of the performance bond, including all details and conditions.

PART 97 – AMATEUR RADIO SERVICE

1. The authority citation for Part 97 continues to read as follows:

Authority: 47 U.S.C. 151-155, 301-609, unless otherwise noted.

2. Amend Section 97.207 by revising paragraph (g), and adding paragraph (h), to read as follows:

§ 97.207 Space station.

* * * * *

(g) * * *

(1) * * *

* * *

(iii) A statement that the space station operator has assessed and limited the probability, during and after completion of mission operations, of accidental explosions or of release of liquids that will persist in droplet form. This statement must include a demonstration that the integrated probability of debris-generating explosions for all credible failure modes of the space station (excluding small particle impacts) is less than 0.001 (1 in 1,000) during deployment and mission operations. Energy sources include chemical, pressure, and kinetic energy. This demonstration should address whether stored energy will be removed at the spacecraft's end of life, by depleting residual fuel and leaving all fuel line valves open, venting any pressurized system, leaving all batteries in a permanent discharge state, and removing any remaining source of stored energy, or through other equivalent procedures specifically disclosed in the application;

* * *

(iv) * * *

(A) Where the application is for an NGSO space station or system, the following information must also be included:

(1) A demonstration that the space station operator has assessed and limited the probability of collision between any space station of the system and other large objects (10 cm or larger in diameter) during the total orbital lifetime of the space station, including any de-orbit phases, to less than 0.001 (1 in 1,000). The probability shall be calculated using the NASA Debris Assessment Software or a higher fidelity assessment tool. The collision risk may be assumed zero for a

space station during any period in which the space station will be maneuvered effectively to avoid colliding with large objects. For systems consisting of multiple space stations, the statement must also include an assessment of the total probability of collision, calculated as the sum of the probability of collision associated with each individual space station. Where the total probability of collision exceeds 0.001 (1 in 1,000) assuming a 10% failure rate of any maneuvering capability at an orbit that presents the worst case for collision risk, the statement must include an additional demonstration of the expected failure rate of maneuverability, and the orbit where the operator would expect most failures to occur, and calculate the total probability of failure based on those assumptions.

* * *

(4) The statement must disclose the accuracy, if any, with which orbital parameters will be maintained, including apogee, perigee, inclination, and the right ascension of the ascending node(s). In the event that a system is not be maintained to specific orbital tolerances, *e.g.*, its propulsion system will not be used for orbital maintenance, that fact should be included in the debris mitigation disclosure. Such systems must also indicate the anticipated evolution over time of the orbit of the proposed satellite or satellites. All systems should describe the extent of satellite maneuverability, whether or not the space station design includes a propulsion system. For space stations deployed into the portion of the low-Earth orbit region above 400 km, the operator must certify that the space stations will be designed with the maneuvering capabilities sufficient to perform effective collision avoidance throughout the period when the space stations are above 400 km.

* * *

(vii) * * *

(D) * * *

(2) * * *
* * *

b. An assessment as to whether portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, and demonstration that the calculated casualty risk for an individual spacecraft using the NASA Debris Assessment Software or a higher fidelity assessment tool is less than 0.0001 (1 in 10,000). For systems consisting of multiple space stations, the statement must also include an assessment of the total casualty risk associated with the system, calculated as the sum of the casualty risk associated with each individual space station. For applications for either a single space station or multiple space stations, where portions of any individual spacecraft will survive atmospheric re-entry and impact the surface of the Earth with a kinetic energy in excess of 15 joules, the statement must also include a description of strategies considered to reduce

casualty risk, such as use of materials designed to demise upon reentry and/or targeted re-entry, and the extent to which those strategies were incorporated into the mission profile

* * * * *

(h) At least 90 days prior to the planned launch of the space station, the licensee grantee or owner of each space station must submit a signed statement stating that upon issuance of a license by the Commission, the license grantee or owner will be responsible for indemnifying the United States against any costs associated with a claim brought under a provision of the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies or Convention on International Liability for Damage Caused by Space Objects related to the facilities that are the subject of the license.

APPENDIX E**Initial Regulatory Flexibility Analysis**

As required by the Regulatory Flexibility Act of 1980, as amended (RFA),¹ the Commission has prepared this present Initial Regulatory Flexibility Analysis (IRFA) of the possible significant economic impact on a substantial number of small entities by the policies and rules proposed in this Further Notice of Proposed Rulemaking (Further Notice). Written public comments are requested on this IRFA. Comments must be identified as responses to the IRFA and must be filed by the deadlines specified in the *Notice* for comments. The Commission will send a copy of this Further Notice, including this IRFA, to the Chief Counsel for Advocacy of the Small Business Administration (SBA).² In addition, the Further Notice and IRFA (or summaries thereof) will be published in the Federal Register.³

A. Need for, and Objectives of, the Proposed Rules

The Further Notice proposes several changes to 47 CFR parts 5, 25, and 97. Principally, it seeks comment on and proposes to:

- 1) Include a metric in the Commission's rules regarding the probability of accidental explosions during and after the completion of satellite mission operations;
- 2) Specify how the Commission will assess probability of collision with large objects and casualty risk on a system-wide basis;
- 3) Adopt an applicant certification that NGSO space stations will have capability to perform collision avoidance maneuvers during any period when the space stations are located above 400 km in altitude;
- 4) Adopt a requirement that space station licensees indemnify the United States against any costs associated with a claim brought under a provision of the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies, or the Convention on International Liability for Damage Caused by Space Objects related to the facilities that are the subject of the license; and
- 5) Adopt a bond requirement for space station licensees under part 25 of the Commission rules, tied to successful disposal of the spacecraft following the end of the mission.

B. Legal Basis

The proposed action is authorized under Sections 1, 4(i), 301, 303, 307, 308, and 309 of the Communications Act of 1934, as amended, 47 U.S.C. §§ 151, 154(i), 301, 303, 307, 308, and 309.

C. Description and Estimate of the Number of Small Entities to Which the Proposed Rules May Apply

The RFA directs agencies to provide a description of, and, where feasible, an estimate of, the number of small entities that may be affected by adoption of proposed rules.⁴ The RFA generally defines the term "small entity" as having the same meaning as the terms "small business," "small organization,"

¹ See 5 U.S.C. § 603. The RFA, *see* 5 U.S.C. § 601 *et seq.*, has been amended by the Small Business Regulatory Enforcement Fairness Act of 1996, (SBREFA) Pub. L. No. 104-121, Title II, 110 Stat. 847 (1996).

² See 5 U.S.C. § 603(a).

³ *Id.*

⁴ 5 U.S.C. § 604(a)(3).

and “small governmental jurisdiction.”⁵ In addition, the term “small business” has the same meaning as the term “small business concern” under the Small Business Act.⁶ A small business concern is one which: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any additional criteria established by the Small Business Administration (SBA).⁷ Below, we describe and estimate the number of small entity licensees that may be affected by adoption of the proposed rules.

Satellite Telecommunications and All Other Telecommunications

Satellite Telecommunications. This category comprises firms “primarily engaged in providing telecommunications services to other establishments in the telecommunications and broadcasting industries by forwarding and receiving communications signals via a system of satellites or reselling satellite telecommunications.”⁸ Satellite telecommunications service providers include satellite and earth station operators. The category has a small business size standard of \$35 million or less in average annual receipts, under SBA rules.⁹ For this category, U.S. Census Bureau data for 2012 show that there were a total of 333 firms that operated for the entire year.¹⁰ Of this total, 299 firms had annual receipts of less than \$25 million.¹¹ Consequently, we estimate that the majority of satellite telecommunications providers are small entities.

All Other Telecommunications. The “All Other Telecommunications” category is comprised of establishments primarily engaged in providing specialized telecommunications services, such as satellite tracking, communications telemetry, and radar station operation.¹² This industry also includes establishments primarily engaged in providing satellite terminal stations and associated facilities connected with one or more terrestrial systems and capable of transmitting telecommunications to, and receiving telecommunications from, satellite systems.¹³ Establishments providing Internet services or voice over Internet protocol (VoIP) services via client-supplied telecommunications connections are also included in this industry.¹⁴ The SBA has developed a small business size standard for “All Other

⁵ 5 U.S.C. § 601(6).

⁶ 5 U.S.C. § 601(3) (incorporating by reference the definition of “small business concern” in 15 U.S.C. § 632). Pursuant to the RFA, the statutory definition of a small business applies “unless an agency, after consultation with the Office of Advocacy of the Small Business Administration and after opportunity for public comment, establishes one or more definitions of such term which are appropriate to the activities of the agency and publishes such definition(s) in the Federal Register.” 5 U.S.C. § 601(3).

⁷ Small Business Act, 15 U.S.C. § 632 (1996).

⁸ U.S. Census Bureau, *2017 NAICS Definitions*, “517410 Satellite Telecommunications”; <https://www.census.gov/cgi-bin/sssd/naics/naicsrch?input=517410&search=2017+NAICS+Search&search=2017>.

⁹ 13 CFR § 121.201, NAICS code 517410.

¹⁰ U.S. Census Bureau, *2012 Economic Census of the United States*, Table EC1251SSSZ4, *Information: Subject Series - Estab and Firm Size: Receipts Size of Firms for the United States: 2012*, NAICS Code 517410, https://factfinder.census.gov/bkmk/table/1.0/en/ECN/2012_US/51SSSZ4//naics~517410.

¹¹ *Id.* The available U.S. Census Bureau data does not provide a more precise estimate of the number of firms that meet the SBA size standard of annual receipts of \$35 million or less.

¹² See U.S. Census Bureau, *2017 NAICS Definitions*, “517919 All Other Telecommunications”; <https://www.census.gov/cgi-bin/sssd/naics/naicsrch?input=517919&search=2017+NAICS+Search&search=2017>.

¹³ *Id.*

¹⁴ *Id.*

Telecommunications”, which consists of all such firms with annual receipts of \$35 million or less.¹⁵ For this category, U.S. Census Bureau data for 2012 show that there were 1,442 firms that operated for the entire year.¹⁶ Of those firms, a total of 1,400 had annual receipts less than \$25 million and 15 firms had annual receipts of \$25 million to \$49, 999,999.¹⁷ Thus, the Commission estimates that the majority of “All Other Telecommunications” firms potentially affected by our action can be considered small.

We estimate, however, that some space station applicants applying under part 25 of the Commission’s rules would qualify as small entities affected by these rule changes. If the Commission were to apply the bond requirement to amateur and experimental space station licensees, then additional small entities would be affected by the rule changes.

D. Description of Projected Reporting, Recordkeeping, and Other Compliance Requirements for Small Entities

The proposed rules would contain a few additional application disclosures relevant to small entities, including certification of maneuverability and demonstration regarding probability of accidental explosions. With respect to the maneuverability certification, some applicants may need to consider modifications to their satellite design and operational plans to achieve the maneuverability certification.

We observe that most small entities do not launch and operate large satellite constellations and so we believe that proposals for operators to perform certain calculations in the aggregate are not likely to be burdensome. The rules proposed require a system-level assessment to be conducted in several areas for any systems consisting of more than one space station. Some small entities may apply for and operate multiple space stations, and thus this requirement would apply to some small entities as well. However, we believe conducting these assessments is not more significant than the type of technical analysis that an applicant will already be performing in preparing its application for Commission.

The bond requirement proposed in the Further Notice would require part 25 space station licensees to submit a demonstration to the Commission that they have posted a bond that meets the requirements specified in the Commission’s rules. The space station licensee would then need to maintain the bond over the course of the license term, until the disposal of the spacecraft. The Further Notice seeks comment on methods to structure the bond requirement that may reduce costs, and on whether to exempt experimental, amateur, and other categories likely to be relevant to small entities.

E. Steps Taken to Minimize Significant Economic Impact on Small Entities, and Significant Alternatives Considered

The RFA requires an agency to describe any significant, specifically small business, alternatives that it has considered in reaching its proposed approach, which may include the following four alternatives (among others): “(1) the establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities; (2) the clarification, consolidation, or simplification of compliance and reporting requirements under the rules for such small entities; (3) the use of performance rather than design standards; and (4) an exemption from coverage of the rule, or any part thereof, for such small entities.”¹⁸

¹⁵ See 13 CFR § 121.201, NAICS Code 517919.

¹⁶ U.S. Census Bureau, *2012 Economic Census of the United States*, Table EC1251SSSZ4, *Information: Subject Series - Estab and Firm Size: Receipts Size of Firms for the United States: 2012*, NAICS Code 517919, https://factfinder.census.gov/bkmk/table/1.0/en/ECN/2012_US/51SSSZ4/naics~517919.

¹⁷ *Id.*

¹⁸ 5 U.S.C. § 603(c)(1)-(4).

The proposals in the Further Notice would further clarify the authorization process by specifying additional disclosures in the rules, thereby providing applicants, including small entities, with a more complete view of the information that the Commission needs during a typical license or authorization process in order to adequately assess the applicant's orbital debris mitigation plan. The Further Notice also specifically seeks comment on the use of performance, rather than prescriptive, or design, standards in the context of the maneuverability certification.

We also seek comment on whether the impact of a maneuverability requirement on certain small satellite missions could be minimized, such as through a gradual phase-in of the requirement.

In addition to seeking comment regarding the structure of the bond, the Further Notice seeks comment on the appropriate monetary amount for the bond, which could affect the extent of the impact on small entities. Additionally, for NGSO licensees, the Further Notice seeks comment on whether default should be tied to a certain number of undisposed space stations or undisposed mass in orbit. The resolution of this question could affect the extent of the impact of default on small entities, which may in some instances have fewer NGSO space stations in orbit than large entities. The Further Notice seeks comment on some approaches that could eliminate a bond requirement altogether for most small entities.

F. Federal Rules that May Duplicate, Overlap, or Conflict with the Proposed Rules

None.

**STATEMENT OF
CHAIRMAN AJIT PAI**

Re: *Mitigation of Orbital Debris in the New Space Age, IB Docket No. 18-313.*

Shortly after becoming FCC Chairman, I had the opportunity to meet Newton Minow, who was Chairman of the FCC during the Kennedy Administration. To me, the most interesting part of our conversation was his description of how the FCC helped spur the beginning of the U.S. commercial space industry. Chairman Minow famously believed that putting satellites into space was more important than putting a human being there. As he put it, “Communications satellites are more important than sending a man into space because they will launch ideas, and ideas will last longer than men and women.”

Today, our nation’s commercial space sector is growing rapidly. And at the FCC, we have been working hard to help our industry seize the opportunities of the new space age. Because satellites have become smaller and we now have more agile, reusable launch vehicles, we can send large numbers of satellites into low- or mid-Earth orbit. These non-geostationary satellite orbit, or NGSO, constellations could be a game changer, benefiting Americans across the country and making high-speed Internet access a reality for more consumers—particularly those in remote and hard-to-serve areas. That’s why, under my leadership, the Commission has approved 14 applications and market access requests by 11 companies for NGSO systems. Our action in this area fits well with the FCC’s twin goals of closing the digital divide and promoting innovation.

However, more satellites in space means a lot more traffic, especially in low-earth orbit. As we enter a new era in which tens of thousands of new satellites could be deployed, space debris is becoming a more serious concern. If you want a graphic illustration of the problem, just re-watch the movie *Gravity*. In space, even a centimeter-wide object, traveling at tens of thousands of miles per hour, can do massive damage to both manned and unmanned spacecraft. Moreover, parts can break off from rockets and satellites during a launch and remain in orbit for decades. And a collision between two satellites could have a catastrophic impact on the space environment for centuries to come.

So as the FCC facilitates the deployment of new satellite constellations, we also must address the problem of orbital debris. And address it we have. Today, for the first time in 15 years, we are adopting new rules to mitigate the threat posed by orbital debris, including regulations involving satellite design, better disposal procedures, and active collision avoidance. 15 years is an eternity in this fast-moving sector, and the time has come to address this critical issue. The rules that we adopt today take a balanced approach: mitigating the risk posed by orbital debris, while at the same time continuing to light a regulatory path for space-based innovation.

Some of my colleagues asked that we move our consideration of certain issues from the Report and Order to the Further Notice so that we could seek additional comment on them, and I was happy to accommodate that request. But let me make clear that I plan on bringing these issues to closure once we have received additional feedback. Because while our action today is an important step toward addressing the threat posed by orbital debris, there is still more that needs to be done to protect the space environment. It is in everyone’s interest keep the final frontier safe for new and innovative uses. So I look forward to continuing to work with the private sector and other government agencies to implement common-sense solutions to get the job done.

I’d like to conclude by recognizing the staff of the International Bureau for their ongoing efforts to mitigate space debris. Thanks to your efforts, the American people will benefit from the rules adopted in this item. In particular, I’d like to express my gratitude to Jose Albuquerque, Jennifer Gilson, Samuel Karty, Karl Kensinger, Robert Nelson, Sankar Persaud, Tom Sullivan, Troy Tanner, and Merissa Velez.

I’d also thank those from other Bureaus and Offices who have played a critical role in advancing this item: Peter Alexander, Mark Bykowsky, Patrick DeGraba, Jerry Duvall, Virginia Metallo, Marilyn

Simon, and Emily Talaga from the Office of Economics and Analytics; Martin Doczkat, Michael Ha, Nicholas Oros, and Anthony Serafini from the Office of Engineering and Technology; Deborah Broderson, David Horowitz, and Bill Richardson from the Office of the General Counsel; and Thomas Derenge, Paul Moon, and Roger Noel from the Wireless Telecommunications Bureau.

**STATEMENT OF
COMMISSIONER MICHAEL O'RIELLY**

Re: *Mitigation of Orbital Debris in the New Space Age, IB Docket No. 18-313.*

It is clear that FCC orbital debris rules from 2004 are simply not adequate to protect space users from the potential threats presented by the collision of natural or human-created masses. Although technology has improved and new models are available to evaluate and mitigate space trash, a proliferation of manmade objects – literally projectiles of all sizes – continues hurtling through orbits used for satellites, spacecraft, and the international space station. And, this is before taking into account the thousands of new NGSO satellites being launched. For these reasons, I support today's efforts to update our orbital debris rules.

There has been much talk about what role, if any, the Commission has to play here. With this item, I'm pleased that the Chairman ultimately agrees with my position that the FCC is neither prohibited from acting nor should it act unilaterally. Ultimately, the FCC provides licenses or grants market access for these satellite services, so we play a role in the good stewardship of space, and, to that end, we must ensure that our rules are up to date. We can't sit on the sidelines, argue that we have no responsibility or authority over the issue, and pass the buck entirely to other agencies. While we do not know how many of these mega-constellations will go live, how many satellites will actually be launched, and whether these NGSO services will be successful in a competitive marketplace, we do know that things do not always go as planned. This is in no way a criticism of NGSOs or any particular company, but it is unlikely that all market entrants will succeed, leaving a potential vacuum for overseeing what happens to deployed assets. There are already reports of FCC-authorized satellites that did not operate or communicate as expected, one that reportedly got too close to another satellite, and an entity with launched NGSO satellites filed for bankruptcy. On the other hand, it is also not appropriate for the Commission to singlehandedly micromanage and attempt to regulate space. Not only must we consider the economic effects of burdensome regulation, but there are other agencies with far more expertise in certain aspects of space travel and orbital debris than the FCC. Therefore, an appropriate balance is needed.

Today's item achieves that balance. While the draft circulated prior to today's meeting had sections that caused me some concern, I thank the Chairman and my colleagues for accepting my suggestions for improvements. These included aligning our rules more closely with the collision and casualty risk compliance metrics set by an interagency body in which the FCC has participated. But, our work is far from over. Our rules and most of the work performed by other agencies center around the risk posed by orbital debris resulting from a single GSO satellite, not from constellations of thousands of satellites. Therefore, at my suggestion, we moved some issues from the Order to the Further Notice. Specifically, we seek further comment on mitigating the collision and casualty risks and what maneuverability is appropriate for these large constellations. It was apparent that some of the metrics in the circulated item would have forced total redesigns of planned networks or doomed projects altogether. It is of utmost importance that we mitigate the risk of orbital debris, while allowing satellite technology to progress, which could benefit so many Americans, especially in unserved areas.

Two other things of note. Today's item imposes numerous disclosure obligations on topics such as trackability, deployment devices used, the release of persistent liquids, and post-mission disposal. While there is no direct harm in collecting information, it often leads to unnecessarily costly burdens for industry, especially since it is may not be known how this information will be used in the future. I am also not sure the FCC has the total expertise needed to decide many of these matters on its own. This means that there must be close coordination with other expert agencies. We also need to figure out how case-by-case decisions made during the review of one entity's application – but which may serve as precedent for others – are made publicly available.

Finally, the FCC is seeking further comment on whether satellite companies should be required to indemnify the U.S. for any harm from their satellite operation. This is an issue that was appropriately moved to the further notice, joining the post-mission disposal bond proposal. Paying for long-term bonds and determining the uncertain liability of indemnification will greatly increase overall costs, affect financing, and severely disadvantage small businesses, entrepreneurs, and new entrants. If the U.S. wants to be the leader in the current space race, our regulatory processes cannot be more expensive and burdensome than those of other nations. The U.S. has faced this problem in the past, and we have made strides to streamline our rules, but these kinds of ideas could tip the scales and force U.S. companies to go abroad once again.

This is not the last time the Commission will be looking into this matter, and I plan on following these issues closely. I fervently hope that the expert agencies and industry will work with us to ensure a safe orbital environment and preserve the limitless opportunities space provides, and that they understand that time is of the essence. These systems are being launched already, and we need to catch up.

**STATEMENT OF
COMMISSIONER BRENDAN CARR**

Re: *Mitigation of Orbital Debris in the New Space Age, IB Docket No. 18-313.*

It's no secret that I have been skeptical of the FCC's jurisdiction and expertise when it comes to orbital debris. Analyzing collision risk, spacecraft maneuverability, ionic sodium-potassium droplets, tubular cylinder deployers and separation rings—these are not within the Commission's core competencies, to the say the least. Now, some may dismiss my concerns by saying that there are a lot of smart people at the FCC and this stuff is not rocket science. Except it is. It is literally rocket science we're wading into.

Many stakeholders have echoed these concerns over the past few weeks. And that is why I welcomed the chance to work with those stakeholders and my colleagues on edits that have greatly improved the document we vote on today. I want to thank Commissioner Starks in particular for his willingness to collaborate on a series of important changes.

The changes we proposed together align this item more closely with the positions held by expert agencies that have experience in aerospace engineering like NASA, NOAA, and the FAA. As a result of our edits, the Commission now adopts our sister agencies' large object collision and casualty risk standards; we now seek further comment on spacecraft maneuverability and indemnification requirements; and we now take a more cautious and balanced approach to our bond proposal.

With those substantial edits, I can now support the item. So I want to thank the International Bureau for all its work on this decision, and I want to express my appreciation again to Commissioner Starks for his leadership on these issues.

**CONCURRING STATEMENT OF
COMMISSIONER JESSICA ROSENWORCEL**

Re: *Mitigation of Orbital Debris in the New Space Age, IB Docket No. 18-313.*

These days it is hard to think about anything more than the here and now. But if the present crisis has taught us anything, it is that getting ahead of problems is important. This is the best way to prepare for the future. That future is full of challenges—some known, some unknown.

Among the former is the explosion of activity in space, courtesy of so many new constellations and satellite systems. Preparing for this rush is important. Because the opportunities are big, but to realize them we have to get the growing challenge of orbital debris under control.

That's because so much has changed in the space world since the FCC last updated its orbital debris rules in 2004. Back then, there were about 800 satellites in operation and roughly 10,000 pieces of orbital debris larger than ten centimeters. Today there are more than 2,200 operational satellites; 22,300 pieces of orbital debris larger than ten centimeters; and nearly one million pieces of debris larger than one centimeter. Plus over the past year or so this agency has approved more than 13,000 new satellites for launch. More are headed our way. So the potential for debris and collisions is multiplying fast.

How do we plan for this future? We act now to get ahead of it. To this end, after more than a year of work, we now have an update to the United States Government Orbital Debris Mitigation Standard Practices, thanks to an interagency process led by NASA and required by Space Policy Directive-3.

Now it falls to the FCC to update its own rules. And while we should strive to harmonize our policies with this earlier federal update, we also need to be honest and recognize its scope. That's because the issues raised by large constellations are more urgent in commercial activity—where they are already being designed, built, and launched. Moreover, we need to recognize the FCC has unique authority. We are the *only* ones with jurisdiction over commercial space activities.

That makes our work to update the agency's 2004 orbital debris policies really important. And after more than a year of review, our staff developed a range of good ideas though there were a few issues—like indemnification—where we needed to ask deeper questions and learn more. And now we do just that thanks to the willingness of my colleagues to work together and improve what was initially proposed.

But I concur today because while this is a start, there is more we need to do. To that end, we are passing on one of the most important opportunities we teed up in the rulemaking that kicked off this proceeding—tightening the “25-year” rule that allows a satellite and debris from its launch to stay in orbit for 25 years after its mission ends. This rule simply does not make sense in today's orbital environment. According to a NASA study of large constellations, if we fail to start deorbiting satellites that have completed their missions within a more reasonable timeframe, the likelihood of catastrophic collisions will grow. While I would have preferred that we address this here, I appreciate that my colleagues are willing to continue this conversation in an additional rulemaking. I also would have preferred the agency make more progress on the collision risks for large constellations, accidental explosion risk, and maneuverability issues.

Going forward we need to prepare for the future with more speed and urgency if we want the United States to retain our global authority in space matters. Because we are not the only ones looking to the skies for innovation and economic growth. European leaders have already approved funding for the first active debris removal mission. Japan is funding an effort to develop a commercial debris removal service, too. I am convinced we can play a leadership role. But to do so, more work on these issues is necessary.

**STATEMENT OF
COMMISSIONER GEOFFREY STARKS**

Re: *Mitigation of Orbital Debris in the New Space Age, IB Docket No. 18-313.*

While much of the focus has been on the urban areas that have paid the heaviest price during the COVID-19 pandemic, the coronavirus spares no community. In the last few weeks, we've heard about Sioux Falls, South Dakota, which now has by far the largest number of COVID-19 cases per capita of any Midwestern State. Other rural areas like Randolph County, Illinois, Osage County, Oklahoma, and Albany, Georgia, are experiencing surges of infections that could quickly challenge their resources.

Broadband is a key weapon in the fight against COVID-19. With a good broadband connection, people can help limit the spread of the disease while remaining in touch with work, participating in distance learning, and receiving medical treatment via telemedicine. Yet for many of the rural communities that are coping with the first wave of infections, COVID-19 has brought home the consequences of Internet Inequality. In Missouri, Maries County has not even attempted a remote learning program because 30 percent of its students lack broadband access. Following a wave of local hospital closures, small towns throughout the USA are struggling with how they will care with COVID-19 patients with no local doctors and no telemedicine capabilities.

Communities like these may not be focused on orbital debris policy, but today's decision should help them by accelerating the growth of the latest generation of satellite broadband. This technology uses low-earth-orbit satellites to provide internet connectivity with latency and speeds superior to existing satellite broadband options and competitive with cable and fiber offerings. While traditional broadband providers start their networks from urban centers and expand outwards, satellite providers can provide service to everyone once their satellites are operational, regardless of where they live or the population density of their community. Next-gen satellite broadband technology holds tremendous promise for connecting people in the hardest-to-reach communities in rural America, and I'm excited that American companies like SpaceX and Amazon are leading this burgeoning industry.

I appreciate that the Chairman responded to the concerns raised by me and Commissioner Carr with the original draft of this decision. I strongly believe that we should pay close attention to NASA's expertise when it comes to setting specific standards in space policy.

In particular, I'm glad that we revised language regarding two aspects of the draft rules that would have significantly inhibited the growth of next-generation satellite broadband. The draft order originally adopted a standard for collision risk that departed from NASA's recommendation to assess that risk on a per-satellite basis. Similarly, the draft adopted a casualty risk standard that differed from NASA's recommendation both with respect to the chance of injury and by applying it on a per-constellation basis. While we should do our utmost to reduce the risk of collisions or injury, I also agree with NASA's expert judgment that the approach we adopt today preserves safety while we and our sister agencies study whether a different standard makes sense for these constellations.

Space may seem like a long way away from the fight against COVID-19, but the rules we adopt here could have a profound impact on how rural America responds to future crises. I'm pleased we were able to spur American leadership in this promising industry while still promoting space safety. I look forward to seeing the results.

Thank you to the staff of the International Bureau for their hard work on this proceeding.
